Part I

# Getting Started

# About This Manual

Scapple has been designed to be a very simple program to learn and use. This user manual is provided to you as a complete reference of the software. We hope that nobody feels the need to read this manual cover to cover to use the software. Of course, we'd be delighted if you are inclined to do so, but most people want to get down to business with a new program, and the best way you'll find for doing that is in the **Help ▶ QuickStart Guide** menu command. This brief two-page cheat-sheet has everything you need to know to get started and become proficient at using Scapple. For those (hopefully rare occasions) when a more detailed look into how the program works is required, this manual should suffice.

This manual has been written using [Scrivener<sup>1</sup>](http://www.literatureandlatte.com/scrivener.php) and is available from the Help menu, under “Scapple Manual”. You should also find two copies which have been specially formatted to be printed on either US Letter or A4 standard printer paper from our [website<sup>2</sup>](http://www.literatureandlatte.com/support.php).

**Annotating the PDF:** If you wish to make notes and annotate the PDF using software such as Adobe Reader, it is recommended you download a separate copy, or locate the PDF in the Scapple installation and drag a copy out for your own personal use. When Scapple updates, it will very likely overwrite the existing PDF in the installation (often with revisions to the text), which will destroy any of your notes.

## 1.1 Terms and Conventions

Whenever the documentation refers to an action that you must take, the visible name for that action will be formatted **like so**. Button labels, menu items, and keyboard shortcuts will all be displayed in this fashion.

Menus will be displayed in a hierarchy using the “▶” character to separate top-level, sub-menu, and commands. Example: To apply the “Blue Bubble” note style to a selection of notes, invoke the **Format ▶ Note Style ▶ Apply Note Style ▶ Blue Bubble** command.

Keyboard shortcuts will use the following symbols:

- ⌘: the Command key, or the Apple key, is the one located directly to the left and right of your spacebar.
- ⌥: the Option key is also labelled the Alt key on some keyboards, depending on which country you purchased your Mac from. Some laptops only have one Option key on the left side.
- ^: Control is usually located to the left and right of the Option keys on their respective side. Some laptops only have one Control key between the Option key and the Fn key on the left side.

---

<sup>1</sup> <http://www.literatureandlatte.com/scrivener.php>

<sup>2</sup> <http://www.literatureandlatte.com/support.php>

- ⌘: the Shift keys are rarely used by themselves in shortcuts but are often used in combination with other modifier keys.
- The arrow keys on your keyboard will often be shortened to the four symbols: ↑ ↓ ← and →.

**Using Keyboard Shortcuts** When a keyboard shortcut requires a combination of modifier keys, they will be printed together. Example: `⌘⌘I` (which matches **View ▶ Show Inspector**) means you should hold down both of these modifier keys together and then tap the **I** key on your keyboard. Some shortcuts in Scapple do not require any keyboard modifiers at all. The **Z** key, for example, will enable the QuickZoom feature while it is depressed. Naturally, these shortcuts cannot be used when editing a note, as the ‘Z’ key all by itself will type in that letter.

**Contextual Menus** On a Mac, these are accessed in two different fashions. If you are using a mouse that has more than one button, click with the right mouse button (or the left button, if using a left-handed mouse). Additionally, most of the Apple-branded trackpads and mice have the ability to program surface areas of the device to access the contextual menu. If you do not have a mouse or trackpad that is capable of supporting more than one type of click, then holding down the Control key and clicking will always work.

## 1.2 Finding Things

Since this PDF has been birthed within the age of digital documentation, and has yet to make its way to print form, a proper index has never been compiled for it. Despite this, in practice you should have little difficulty in locating the topic you are interested in. Modern PDF reader software features excellent searching capabilities; most things can be discovered merely by searching for the proper names of things—as labelled in menus, buttons or dialogue boxes—in the PDF.

Alternatively, the appendices have been designed as a sort of topical index. If you have a question about a particular menu command, for instance, you can find it in the appendix, Menus & Keyboard Shortcuts ([chapter 12](#)). Often, if the feature merits it, there will be a cross-reference to a more thorough description of the feature earlier in the text. When all else fails, a detailed table of contents has been provided at the beginning of the document.

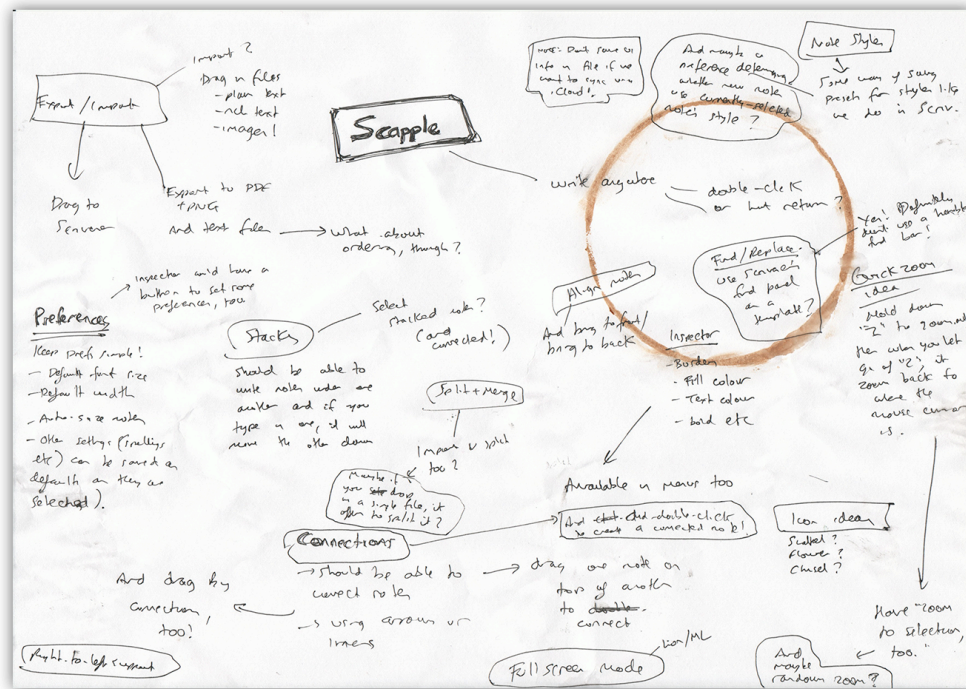

**| What is Scapple?**

**scapple** skap'l vt. to work or shape... roughly, without smoothing to a finish.

—*The Chambers Dictionary*, 12<sup>th</sup> Edition

Scapple is an easy-to-use tool for getting ideas down as quickly as possible and making connections between them. It's the software equivalent of taking a large piece of paper and writing your thoughts and ideas all over it, in no particular order, perhaps clustering related notes and drawing lines and arrows between them as connections become apparent.

**Figure 2.1** Ideas scrawled on paper

We don't claim that there's anything new or original about this process, of course—there are whole books dedicated to similar planning techniques, such as *Writing the Natural Way* by Gabriele Rico, and if you've ever worked in any sort of office environment, you've probably been forced to endure a “brainstorming” session in front of a whiteboard. But what's oppressive when your boss is manically wielding a marker pen can be liberating and productive when you are thinking about your own projects.

The idea behind Scapple was to take this process and incorporate it into a simple and lightweight application: something no more difficult to use than pen and paper, but which confers certain advantages that only computers can provide; advantages such as the following:

- You never run out of paper, because the Scapple document expands to fit as many notes as you want to create.

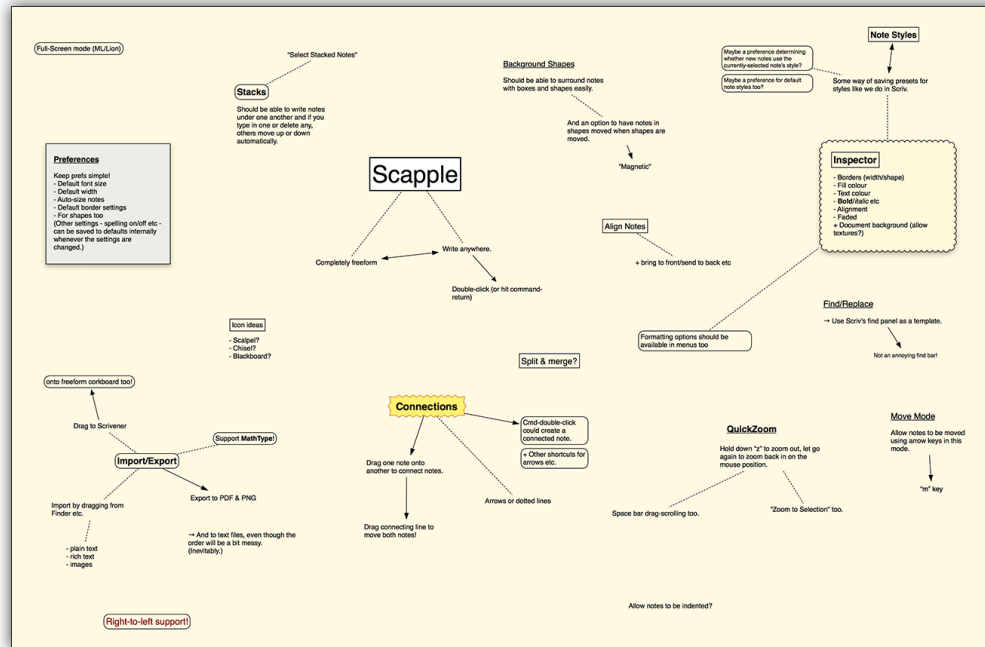

Figure 2.2 Ideas scrawled in Scapple

- You can move notes around and make room for new ideas and connections.
- It's easy to delete, edit and resize notes.
- You don't have to retype everything into another format when you are done.

There is a veritable panoply of mind-mapping software out there, but what's different about Scapple is that it doesn't force you to make connections; nor does it expect you to start with one central idea and branch everything else off that. Instead, you are free to write anywhere on the virtual paper. Individual notes can be as long or short as you like. Its freeform approach gets out of your way so that you can focus on getting all of your ideas down, moving them around, and discovering and making connections as you go along.

It's also so simple to use, we hope, that once you've read the two-page Quick-Start Guide (available from the Help menu), you'll know everything you need. And even if you don't read a word of the QuickStart Guide, the two-sentence instructions that appear when you create a new blank document should be more than sufficient to get started: "Double-click anywhere to create a note. Drag notes onto one another to make connections."

# **Registration & Updates**

If you purchased Scapple from the Mac App Store, you can safely skip this section, as it pertains to the registration and maintenance of the version of Scapple we sell through our own site. Installation, activation and application updates will be handled for you by the Mac App Store application.

## 3.1 Installation

1. Download Scapple from the Literature & Latte website. There is no difference between the trial version and the registered version—you turn the trial version into the regular version by purchasing a serial number and using it to activate the trial version.
2. When the Scapple DMG (disk image) file finishes downloading, double-click on it in the Finder (if it hasn't opened for you automatically), and drag the Scapple icon into your Applications folder.  
**Important:** Scapple will not be correctly installed on your system if you drag the icon directly from the DMG to the Dock—it must be dragged onto your hard disk first.
3. To add Scapple to your Dock, drag it there from the Applications folder, or right-click on its icon in the Dock after it has been launched, and select **Options ▶ Keep in Dock** from the contextual menu.
4. Once you have installed Scapple, you should eject the DMG from your computer by clicking on the eject icon next to the Scapple volume in the Finder.

Note that if you attempt to run Scapple from a non-standard location—such as directly from the DMG—you will see a warning message which will offer to install Scapple to the Applications directory for you. This can be dismissed if you have intentionally installed it to a non-standard location.

## 3.2 Registration

You can try out all of the features of Scapple for 30 non-consecutive days without having to pay or register. During that period, Scapple will be fully-functional. After 30 days of use, you will no longer be able to access Scapple unless you register.

### 3.2.1 Purchasing Scapple

During the trial period, whenever you launch Scapple, you will be reminded of how many trial days you have left and given the option of buying and registering. Clicking on the “Buy Online” button will take you to the Literature & Latte online store, where you can purchase a licence for Scapple. You can also visit the online store at any time by selecting “Purchase Scapple...” from the Help menu.

When you buy a licence, you will be emailed your unique serial number, which will have the following format:

SCAPPLEXXX-XXXX-XXXX-XXXX-XXXX-XXXX

Make sure you hold on to this serial number, along with the exact name under which you registered Scapple (the “Serial Number Name”), as you will need both to register Scapple again in the future. (Remember that you may need to re-register at a later date—for instance when installing Scapple on a new system, or re-installing after wiping your hard drive for some reason—so it is important to store this information safely.)

If you have lost your serial number, clicking on “Retrieve Lost Serial...” in the registration window will take you to our vendor’s self-service support site, where you can request to have the information re-sent to you. If you do not have the necessary information available to fill out that form, please contact us via our [support e-mail address](mailto:sales@literatureandlatte.com)<sup>1</sup>, and we will be happy to look up the information for you.

### 3.2.2 Registering Scapple

After purchasing a licence and receiving your unique serial number, you can register Scapple by clicking on the “Enter License...” button in the “Scapple is unregistered!” box that appears whenever you launch Scapple. Alternatively, you can choose “Register...” from the application (Scapple) menu.

In the “Serial Number Name” box of the registration window, enter the exact name under which you registered Scapple. Enter your unique serial number in the “Serial Number” box, then click the “Register” button. You must make sure that both the user name and serial number are exactly as they appear in the registration email you received, or registration will fail.

If you receive a message stating that the name or serial number is invalid:

- Check and make sure they are in the right order. The name of the software owner should be in the top field, and the serial number in the second field.
- Try using Copy and Paste to transfer the information from the email to this form and make sure that when you select the text in the email, the selection range does not extend beyond the first or last letter or number in the name or serial number.
- If all else fails, quit and relaunch Scapple. This can sometimes clear out pesky gremlins in registration procedures.

After clicking the “Register” button, Scapple will authenticate your copy over the internet. No personal information is relayed during this process. If for some

---

<sup>1</sup> <mailto:sales@literatureandlatte.com>

reason the internet is not available, you will receive a warning message with instructions on how to activate the software manually. A URL will be provided which you can use on another machine to access the activation code you'll need to complete the registration process on the original computer. Scapple will continue to work in the interim—you will just see a nag message each time you launch Scapple until activation has been completed successfully.

Once Scapple has been registered, you can begin using it. There will no longer be a time limit on its use, and you will no longer see the trial nag box at startup.

## 3.3 Application Updates

The second time you ever run Scapple, you will be presented with a panel which asks whether or not Scapple should automatically check for updates. (To use this feature, you must have a connection to the internet.)

If you click “Check Automatically”, then once a day when you launch Scapple, if your computer is connected to the internet, Scapple will do a quick check to see if there is a newer version available and will prompt you to update if one is found. (It is strongly recommended that you always update to the newest version available.)

Choosing “Don’t Check” will disable automatic checks, in which case you will want to select “Check for Updates...” in the application (Scapple) menu from time to time to check for updates manually.

You can change your mind later by setting this option in the application preferences ([chapter II](#)). You can also adjust the frequency of the automatic checks in the preferences.

When a check finds available updates, a window will appear outlining the details of the update. It is recommended that you take a quick look through the update notes, as occasionally certain changes in operation may be implemented. You can view the full list at any time by following the link on the product page on our website.

To update the application when an update has been found, click the “Install Update” button. Scapple will then download and install the latest version of the program for you. When the download and installation is complete, you will be presented with a button to restart the program. Click this, and after Scapple restarts it will be up to date.

**Software vs. Your Work:** The advent of mobile operating systems for tablets and smart phones has unfortunately blurred the line between what a program is and what your data is. On many of these devices, deleting or re-installing an application can destroy your work. Standard operating systems won't work that way. Like all programs on your computer, Scapple saves your work into files (or documents). There is absolutely no connection between the software and your hard work. Upgrading versions, registering your trial, switching to a beta build or even deleting the application entirely will have no impact on the files you created with Scapple (save that you of course will not be able to open them so long as Scapple is not installed; your work will be accessible once the software is available again).

# **Learning the Ropes**

There aren't really any difficult concepts to get your head around in Scapple—the most difficult part of using Scapple should be the ideas on which you are working. You organise those ideas using four main elements: *notes*, *connections*, *background shapes* and *stacks*. We'll look at each of those here.

## 4.1 Scapple's Main Interface

Scapple's interface has been designed to be as minimal as possible—for the most part, it's just you and your notes. The provided screenshot of the interface (Figure 4.1) has been numbered and explained, below.

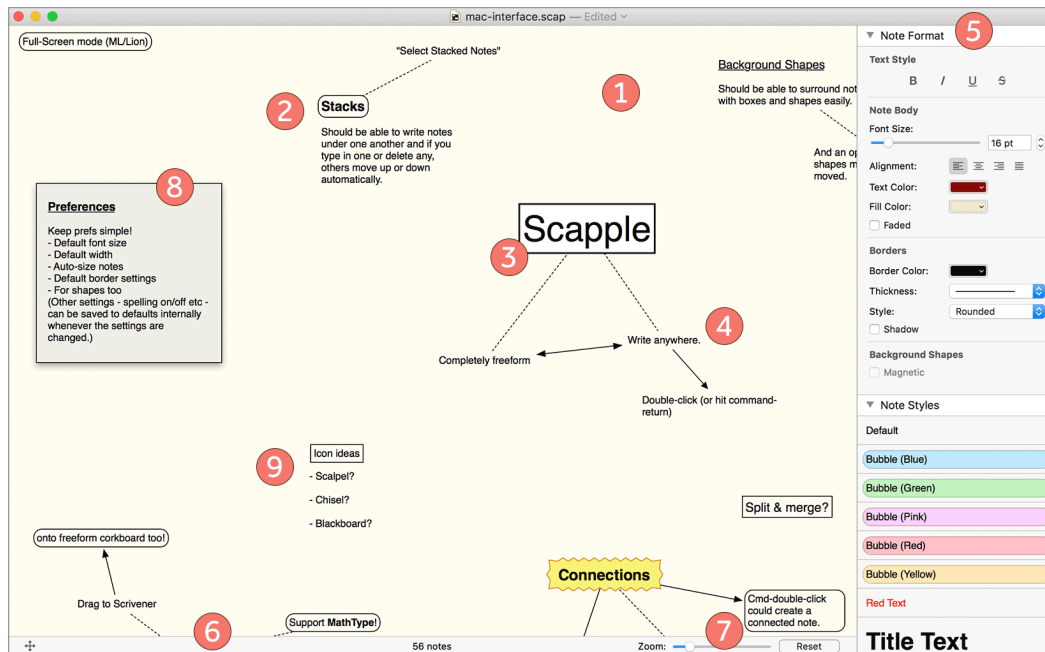

Figure 4.1 The default Scapple window and features

1. The **Scapple board**, or canvas. “Scapple board” is the term used to describe a Scapple document—all of the notes and their connections as laid out on the virtual paper. The “canvas” is the background, or the virtual paper.
2. A **note**. A Scapple board can contain as many individual notes as you want. Notes can be long or short, can wrap across multiple lines, and can be formatted with borders, text colour, fill colour, bold, italics, underline and strikethrough.
3. A **connecting line** between notes. Connecting lines are always dotted lines unless there is an arrow at either end (or at both ends).
4. An **arrowed connecting line** between notes. Since the line has an arrow, it is solid. Arrows can be on either end, and can even be on both ends, as shown to the left of #4 in the figure.

5. The **inspector**. This can be revealed by selecting the **View ▶ Show Inspector** menu command (or by hitting `⌘I`).
6. The **footer bar**. The number of notes is displayed in the centre of the footer bar. If more than one note is selected, the number of selected notes is also displayed.
7. The **scale slider** and scale “Reset” button. Move the slider to zoom in and out of the Scapple board, and click “Reset” to reset the scale to the default. You can also use the keyboard shortcuts `⌘↑` and `⌘↓` to zoom in and out respectively, or **Z** by itself to show the entire canvas so long as the **Z** key is held down.
8. A **background shape** around two notes. As with notes, shapes can be styled in many ways. This shape has a drop-shadow, fill colour, square shape and a black border.
9. A **stack** of notes. Stacks are vertical groups of notes that can be easily edited and selected together as a list.

## 4.2 Notes

You can create and move notes anywhere on a Scapple board. Notes can be anything—a single word used as a title using a large, bold font, or several paragraphs of detailed description. There are no limits to how you arrange them—Scapple boards are entirely freeform.

### 4.2.1 Creating Notes

To create a new note, do one of the following:

- Double-click anywhere on the background canvas area to create a new note at the mouse point. By default, the new note will have the placeholder text “New Note” selected, ready for you to type over it with your own text.
- If any notes are selected, you can hold down modifier keys while double-clicking to create a new notes that are connected to the selected notes. Holding down the Option (`⌥`) key will create a new note that is connected by an arrow pointing to the new note; holding down the Command (`⌘`) key will create a new note that is connected by a dashed line to the selected notes.
- Use **Notes ▶ New Note** (`⌘Return`). If there are no notes selected, this will create a new note in the view area. If there is a note selected, this will create a new note directly underneath the selected note—in which case the menu item will appear as “New Stacked Note” in the Notes menu ([section 4.5](#)).

- You can also use one of the options in the **Notes ▸ New Connected Note** submenu to create a new note that is connected to the selected note (these options are only available if one or more notes are selected). You can create a new note connected to the selected note by a dotted line or by an arrow. The associated keyboard shortcuts can also be used to create a new note connected by a dotted line above, below, to the left or right of the selected note (such as  $\text{^}\text{⌘}\text{←}$  to create a new note to the left), or to create a new note connected by an arrow above, below or to the left or right of the selected note (such as  $\text{^}\text{⌘}\text{⌘}\text{←}$  to create an arrow pointing to the new note to the left).
- To add a new note *between* two connected notes, you can double-click on the connecting line (Figure 4.2). This will cause the connection between the two existing notes to be removed, and new connections to be created between the existing notes and the new note. If you make a mistake when doing this, simply use Undo to get rid of the new note and reconnect the existing notes.  
See also: Labelling Connection Lines (subsection 4.3.5).
- You can create a new note with any given style by dragging the style out of the “Note Styles” section of the Inspector into a blank area on the board. This action can be combined with the modifier key drags described above to create linked notes in that style.

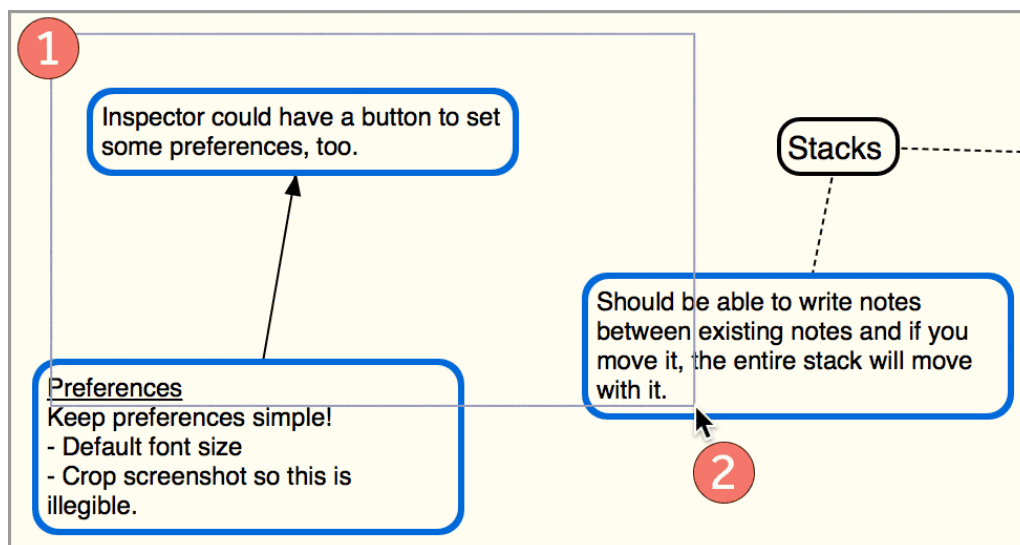

**Figure 4.2** Double-click the connection line to create a new note between them

### 4.2.2 Selecting Notes

To select notes, do one of the following:

- Click on a note to select a single note.

- To select multiple notes, click on each note in turn while holding down the Shift or Command key. This also acts like a toggle, and can be used to remove a note from a selection.
- Use the arrow keys to select or travel to notes around the board. Stacked notes will prefer each other for selection, after that the program will do its best to select the next note in the direction of the arrow key you pressed. Hold down the Shift key to add the other notes to the existing selection, much like when extending a text selection in an text editor.
- Perhaps the easiest way of selecting multiple notes is to use the marquee selection tool (Figure 4.3). To do so, simply click anywhere on the board outside of a note and then drag the mouse with the left button still held down. A rectangle will appear that moves with the mouse, and as you drag to resize the rectangle, anything that is enclosed by or touches the rectangle will be selected. Release the mouse button to finish using the marquee selection tool.  
Holding down the **Option** key while dragging will *remove* notes from the current selection.
- If you wish to discard a selection, you can click anywhere on the board background with the mouse, or use the **Edit/Deselect** (⌘D) menu command.
- To flip the selection state for the entire board, use **Edit ▸ Invert Selection** (⇧⌘I). If for instance a board has three notes, “A”, “B” and “C”, and “C” is selected, the result of this command would have “A” and “B” selected.

**Figure 4.3** Click and hold at (1) then drag and release the mouse button at (2)

### 4.2.3 Editing Notes

To edit a note, do one of the following:

- Double-click into it.
- Select the note and hit the Escape key.
- Return can be used to start editing, but only if “Return creates new notes” is disabled in the General Preferences ([chapter 11](#)) tab.

To finish editing a note, do one of the following:

- Hit the Escape key.
- Select another note or click elsewhere on the Scapple board.
- Hit the Enter<sup>1</sup> key.
- If “Return ends editing” is ticked in the General Preferences tab, hit the Return key.

The Return and Enter keys only act the same if “Return ends editing” is ticked in the Preferences (this is not ticked by default). Enter will *always* end editing, but Return will by default start a new paragraph.

### 4.2.4 Moving Notes

#### With the Mouse

Movement is typically done with the mouse, in a manner that will be familiar to anyone who has dragged and dropped files from one location to another in Finder.

- To move a note, simply click on it, hold down the left mouse button, and drag it to its new location, letting go of the button when you are satisfied with its position.
- To move several notes, first select all the notes that you wish to move ([subsection 4.2.2](#)). Then click on one of the selected notes, keep the mouse button held down, and drag to move all selected notes.
- To move two connected notes together, there is no need to select them both. Just click the connecting line that joins them, hold down the mouse button, and drag.

---

<sup>1</sup> Not to be confused with the Return key. On a full-sized keyboard, the Enter key will be beside the numberpad, and the Return key beside the letter keys. On most laptop keyboards, Enter is used by combining the Fn key and the Return key.

When moving notes so that they will end up partially or completely outside of the board, the overall size of the board may be increased to fit them. For example if you select five notes, and start the drag from the lower-right note, so that this note is the only one visible at the top-left corner of the screen, the other notes will “push” the boundary of the canvas up and to the left if necessary to make space for them.

As you drag closer to the edge of the view, Scapple will scroll in that direction for you, while you are dragging, gradually increasing in speed the longer you hold down the mouse button. This lets you position notes off-screen from where they started.

**Long Distance Travel:** Sometimes you need to move a note from one point of a large canvas to another. You could zoom all the way out, drag it, and then zoom back in. However an easier technique would be to use the QuickZoom feature ([chapter 7](#)). First, select the notes and then hold down the **Z** key. Now drag them to the proper location, and let go of both the **Z** key and the mouse button. The selected notes should remain visible as QuickZoom focusses the view based on where your mouse pointer is (which in this case will be where you dropped the notes). Your selection will remain after doing so, making it easy to fine tune the positioning at full scale.

## With the Keyboard

Sometimes small adjustments are easier to make with the arrow keys on the keyboard, especially if you wish to make sure that the note does not stray from its original horizontal or vertical positioning (or axis). By default the arrow keys will select notes around the currently selected note, but if you tap the **M** short-cut, Movement Mode will be enabled ([Figure 4.4](#)). Now the arrow keys will push the selected notes in the direction of that arrow by a small amount. If you would like to increase how far it moves with each keypress, hold down the Shift key in combination with the arrow keys, and hold down Command-Shift together to increase the speed even further. You can hold down the arrow key instead of tapping to move longer distances.

**Figure 4.4** Movement mode is indicated by this icon, in the lower left corner of the status bar.

## 4.2.5 Copying Notes

To copy notes, select the notes you wish to copy and then do one of the following:

- Drag the notes to location you wish the copies to appear and hold down the **Option** key while releasing the mouse button. When the **Option** key is held down, you will notice that the mouse pointer will have a “+” icon beside it, which indicates that the note will be copied rather than moved.
- Select **Edit ▶ Copy** (⌘C) then select **Edit/Paste** (⌘V). When you select Paste from the Edit menu or use the shortcut, the note will be pasted into the rough centre of the view; when you select Paste from the contextual menu (right-click, or ctrl-click if your mouse or trackpad is not configured to use two buttons), the note will be pasted at the point where you right-clicked.

Scapple notes can be copied and pasted from one board to another, and can even be pasted as text into a text editor like Scrivener or Microsoft Word. Read more about importing and exporting via Copy and Paste ([subsection 9.2.3](#)).

## 4.2.6 Resizing Notes

To resize a note:

1. Move the mouse over the left or right edge of the note, until the cursor changes to the resizing handle icon. Images can be resized from any side<sup>2</sup>, as can background shapes ([section 4.4](#)).
2. Click and drag the mouse left or right to make the note narrower or wider. Text notes will rewrap, automatically getting taller or shorter, to fit the text to the new note width.

**Resizing Notes from the Middle:** For notes that have been centre aligned, or just in any case where you would like to resize the note from the middle of it rather strictly left or right, you can hold down the **Option** key while dragging. This also works for Shapes, in the up and down direction.

To resize multiple notes:

1. Select all the notes you want to resize.
2. Move the mouse over the left or right edge of any one of the notes, until the cursor changes to the resizing handle icon.

---

<sup>2</sup> See Getting Work Into Scapple ([section 9.1](#)) for information on how to import images.

3. Click and drag the mouse left or right to make all selected notes narrower or wider.

When multiple notes are selected, you can make them all the same width by using the **Notes ▶ Make Same Width** menu command. This will not align them (use the **Notes ▶ Align ▶** sub-menu for that), merely resize them in place. Images and background shapes can have their height equalised as well, with **Notes ▶ Make Same Height**.

### 4.2.7 Deleting Notes

Deleted notes are removed immediately from the board, but you can always use **Edit ▶ Undo** if you make a mistake.

1. Select the notes you wish to delete.
2. Use **Edit ▶ Delete** or hit the **Delete** key on the keyboard.

### 4.2.8 Splitting and Merging Notes

Sometimes, you may have long notes that you wish to split up into smaller notes, or you may have a bunch of related notes that you wish to merge into one.

- Single notes can be split into two notes:
  1. Double-click into a note to edit it.
  2. Place the blinking insertion caret at the point in the text where you want to split the note (you can ignore whitespace, all extra spaces and carriage returns will be trimmed from both notes after splitting).
  3. Choose **Notes ▶ Split (⌘⌘K)**. The new split note will be created stacked underneath the existing note.
- A specific selection of text can be split off into a new note:
  1. Double-click into the note containing the text to edit it.
  2. Select the text you wish to split into a new note.

Figure 4.5

3. Choose **Notes ▶ Split**. A new note will be created containing the selected text, stacked directly underneath the existing note. The selected text will be removed from the original note.
- Merging several notes:
    1. Select the notes you wish to merge, ensuring that the first note you select is the one you wish the notes to be merged into. The remaining notes in the selection will be sorted based upon their distance from the first.
    2. Choose **Notes ▶ Merge**.

See Also:

- Stacks ([section 4.5](#)).
- Selecting Notes ([subsection 4.2.2](#)).

## 4.2.9 Changing the Appearance of Notes

You can change the appearance of notes in several ways:

- Add a coloured border.
- Change the fill (background) colour of notes.
- Change the text colour.
- Make text bigger or smaller.
- Add bold, italics, underline or strikethrough.
- Change the overall shape of the note.
- You can also change the font and background colour used for the Scapple board.

To change the appearance of notes, select the notes you wish to affect, and then use one of the following methods:

- Use the “Note Format” section of the Inspector, which can be opened by choosing **View ▶ Show Inspector** (**⌘I**).
- Use the commands available in the Format Menu ([section 12.6](#)). A selection of common commands can be accessed from the right-click contextual menu.
- Apply a note style preset using the **Format ▶ Note Style ▶ Apply Note Style ▶** sub-menu (also available in the contextual menu).

- Apply a note style preset using the “Note Styles” section of the Inspector sidebar ([section 10.2](#)).

See Also:

- The Inspector ([chapter 10](#))
- Formatting & Appearance ([chapter 6](#))
- Note Style Presets ([section 6.3](#))

### 4.2.10 Aligning Notes

Notes can be aligned along several different edges or axes:

1. Select the notes you wish to align. The first note you select will not be moved—other selected notes will be moved to align with the note that was selected first.
2. Go to the **Notes ▶ Align ▶** sub-menu and then choose from “Left Edges”, “Right Edges”, “Top Edges” or “Bottom Edges”.
3. Aligning by “Horizontal Centers” will cause the notes to end up in a column, aligned by their horizontal width. Aligning by “Vertical Centers” will result in a row, with their vertical middles used to determine the placements.

If you want to arrange notes into a single column, it is often more useful to “stack” them rather than align them ([section 4.5](#)).

### 4.2.11 Arranging Overlapping Notes

You will most likely wish to avoid having notes arranged on top of each other, as this will often result in text being obscured and thus make things difficult to read. However, there may be occasions where you have a note partially overlapping another and you wish to arrange their front-to-back order, so that the note underneath is brought to the front, or vice versa. This is easy to do.

Bring a note partially obscured by other notes to the front:

1. Select the note you wish to bring to the front.
  2. Use **Notes ▶ Bring to Front** (**⌘F**).
- Alternatively, right-click on the note and select “Bring to Front” from the contextual menu.

To send a note obscuring another note to the back:

1. Select the note you wish to send to the back.

2. Choose **Notes ▶ Send to Back** (⌘⌘{}).

Alternatively, right-click on the note and select “Send to Back” from the contextual menu.

Background shapes, as their name implies, are always located on the bottom layer beneath all notes. They can however be arranged among themselves, using these same commands.

## 4.3 Connections

When you’re throwing ideas around on the page, some notes exist in isolation, while others are connected. In Scapple, you are free to connect your ideas however you like. Making connections is as simple as dragging and dropping one note onto another—meaning any note can be connected to any other note. Notes can be connected by simple dotted lines, or by lines with arrows at one or even both ends.

Connections in Scapple, unlike those in most diagramming and mind-mapping applications, don’t have any internal meaning<sup>3</sup>, and are fundamentally a means of connecting your ideas *visually*, just as you might draw lines or arrows between notes on a piece of paper.

### 4.3.1 Creating Connections Between Notes

Two or more notes can be connected with a dotted line:

1. Drag one note over the top of another note—notice that when you do so, the cursor changes to a curled arrow and the note beneath the pointer becomes darker, to indicate that a connection will be made when you drop.
2. Release the mouse button to drop the dragged note onto the other. A dotted line will now connect the two notes (the notes will stay in their original positions).

Alternatively, select the notes you wish to connect and choose **Notes ▶ Connect** (⌘>). The note you select first will be the one they connect to. This command is also available from the contextual menu.

If you would like to connect all of the selected notes together, use **Notes ▶ Connect All**.

Two or more notes can have arrows drawn between each other:

---

<sup>3</sup> They can have some effect on the order in which notes are exported to text formats; see Getting Work Out of Scapple ([section 9.2](#)).

1. Drag one note over the top of another note—notice that when you do so, the cursor changes to the curled arrow and the note beneath the cursor becomes darker, to indicate that a connection will be made when you drop.
2. **Arrow to:** hold down the **Option** key before you release the mouse button to drop the dragged note onto the other. A line will connect the two notes, with an arrow pointing from the dragged note towards the note onto which you dropped it.
3. **Arrow from:** in the same fashion, hold down the **Option** and **Command** keys together when dropping to create an arrow pointing *from* the note you dropped onto, pointing back to the initial selection.
4. **Double-Arrow:** to create a new connection line that is double-ended from the start, hold down the **Shift** and **Command** keys when dragging from one note to another.

Alternatively, select the notes you wish to connect and choose **Notes ▶ Connect With Arrow** (⌘⌥.). The arrows will point from the first note selected to subsequently-selected notes (see the Selecting Notes section for more information on selecting notes). This command is also available from the contextual menu.

Notes can also be connected as they are created ([subsection 4.2.1](#)).

### 4.3.2 Removing Connections

Connections are removed in the same fashion they are created:

1. Drag one note over the top of another note to which it is currently connected—notice that when you do so, the cursor changes to the curled arrow and the note beneath the cursor becomes darker, to indicate that the drop operation will affect the connected status.
2. Release the mouse button to drop the dragged note onto the other. The connection between them will disappear.

Alternatively, select all of the notes you wish to disconnect and choose **Notes ▶ Disconnect** (⌘⌥). This command is also available from the contextual menu:

- When selecting individually connected notes, other notes that these selected notes may be connected to will *not* be affected by this command.
- When only a single note is selected, then this command will destroy *all* connections between it and other notes.

### 4.3.3 Changing Connection Types

To change an existing connection between two notes from a dotted line to an arrow, or vice versa:

1. Drag one note over the top of another note to which it is currently connected—notice that when you do so, the cursor changes to the curled arrow and the note beneath the cursor becomes darker, to indicate that the drop operation will affect the connected status.
2. Holding down the **Option** key, release the mouse button to drop the dragged note onto the other. If the connection between the notes was previously a dotted line, it will now be an arrow pointing from the dragged note to the note onto which you dropped it; if the connection between the notes was formerly an arrow, if there is no arrow at the other end of the line it will now be a dotted line, or if it was previously a line with arrows pointing in both directions, it will now only have an arrow pointing in one direction.

Alternatively, select the notes you wish to affect and choose **Notes ▶ Connect With Arrow** (⌘.) or **Notes ▶ Remove Arrows** (⌘,). The “Connect With Arrow” command will only make arrow connections from the first note selected to subsequently-connected arrows; it will not make arrow connections between every single note.

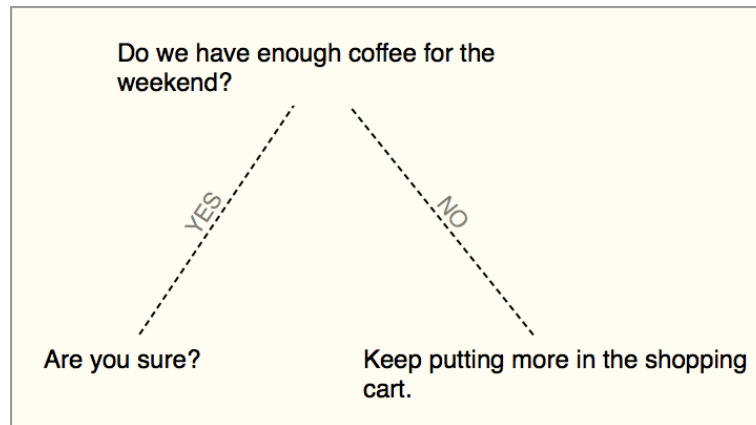

### 4.3.4 Moving Connected Notes

When two notes are connected, you can move them both together simply by clicking and dragging the connecting line between them. See [Moving Notes \(subsection 4.2.4\)](#) for more information about moving notes around.

### 4.3.5 Labelling Connection Lines

At times it can be useful to give your connection lines a label, to help distinguish why two notes are connected together, or explain alternate connections when one note links to several:

1. Select the two notes you wish to have labelled.
2. Use the **Notes ▶ Connection Label...** menu command (⌘L), or right-click on either of the selected notes and choose the “Connection Label...” contextual menu command.
3. Type in the text of your label and click the **OK** button. If the notes were not previously connected then this action will also connect the notes together with a dotted line.

**Figure 4.6** Labelling connections can bring clarity to your diagrams.

To edit a label at a later time, simply double-click on the label directly—or select the two notes with the labelled connection line and use the same menu command used to create a label.

To remove a label from a line, edit the label as described above, and delete all of the text from the provided field. When you click **OK** the label will be removed.

## 4.4 Background Shapes

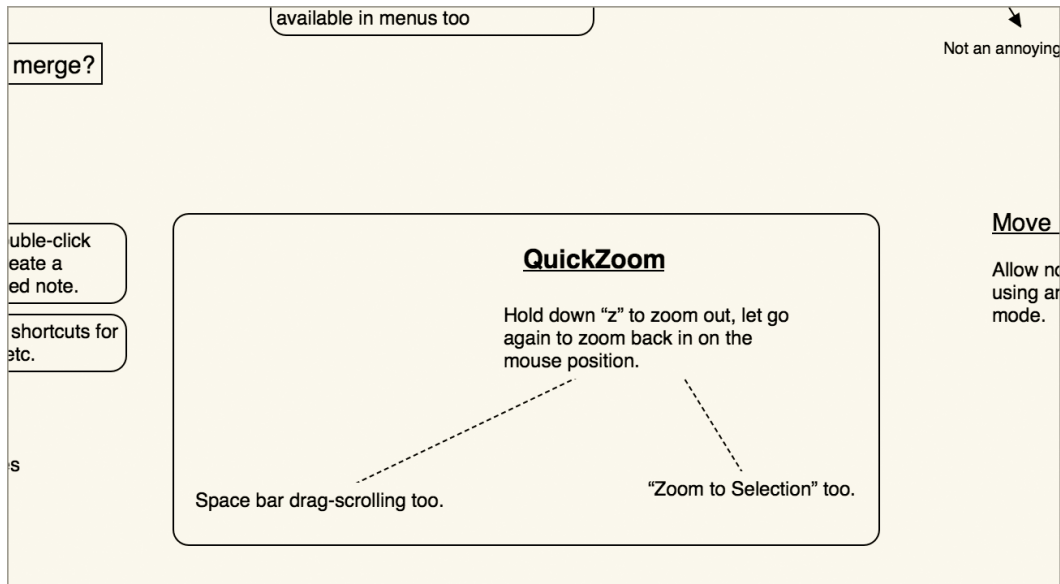

If you're like me, sometimes you want to draw a big circle around a group of ideas. It's an easy way of associating a group of concepts and treating them—for some purposes—as a single entity. In Scapple, Background Shapes accomplish this form of thinking, without adding a lot of complexity. By and large, a background shape acts like a note—it can be dragged around and selected in the same way, and can have many of the same styles applied.

There are a few important differences that set shapes apart from notes:

- They cannot ever hold text by themselves. That is what notes are for.
- In addition to dragging their left and right sides, they can be resized by the top and bottom, or in two directions along their four corners.
- Optionally, background shapes can become “magnetic”, which means that overlapping notes will stick to them when they are moved.
- They always occupy the bottom “layer”, beneath all notes. Background shapes can be brought forward and backward amongst themselves, but they can never *overlap* a note.

A shape considers a note or shape to “belong” to it, if any part of the item overlaps said shape. This impacts **Edit/Select/Overlapping Notes**, what gets moved or copied with the shape when it is Magnetic ([subsection 4.4.4](#)) and when using export formats that support nesting.

**Figure 4.7** The background shape in the middle encloses four notes.

### 4.4.1 Creating Background Shapes

There are two ways to create shapes. You may already have a collection of ideas you wish to “draw a circle around”:

1. Select the notes you wish to enclose.
2. Use the **Notes ▶ New Background Shape Around Selection** menu command. The new shape will be sized to fully enclose all of the selected notes.

Sometimes you need to create a topic that you intend to fill with new ideas:

1. With nothing selected, use the **Notes ▶ New Background Shape** menu command.
2. A new shape will be created in the middle of the current view, which may be beneath other notes. It can now be moved to a free spot if desired.

### 4.4.2 Selecting Shapes

Shapes can be selected in the same manner as notes ([subsection 4.2.2](#)). You can click anywhere in the middle of a shape to select it. There is no need to click precisely on the edge.

### 4.4.3 Selecting Contained Notes

If you need to select all of the notes (and potentially shapes) within a shape:

- Simply hold down the **Option** key and click anywhere within the shape.

- Use the **Edit ▶ Select ▶ Overlapping Notes** <sup>⌘</sup>A menu command.
- Marquee selection can be used within a shape by holding down the **Command** key to temporarily disable selecting the shape itself and dragging it.

**How To Select Just the Enclosed Notes:** If you want to select just the enclosed notes within a shape, but not the shape, perform one of the aforementioned steps to select overlapping shapes, and then hold down the **Command** key and click in the background shape to toggle its selection state.

#### 4.4.4 Moving Shapes and Notes Together (Magnetic)

While you could continue to use the ability to select overlapping notes to move shapes around together with the notes they enclose, you might want a more automatic solution. Setting a background shape to be “magnetic”, using **Notes ▶ Magnetic**, accomplishes this.

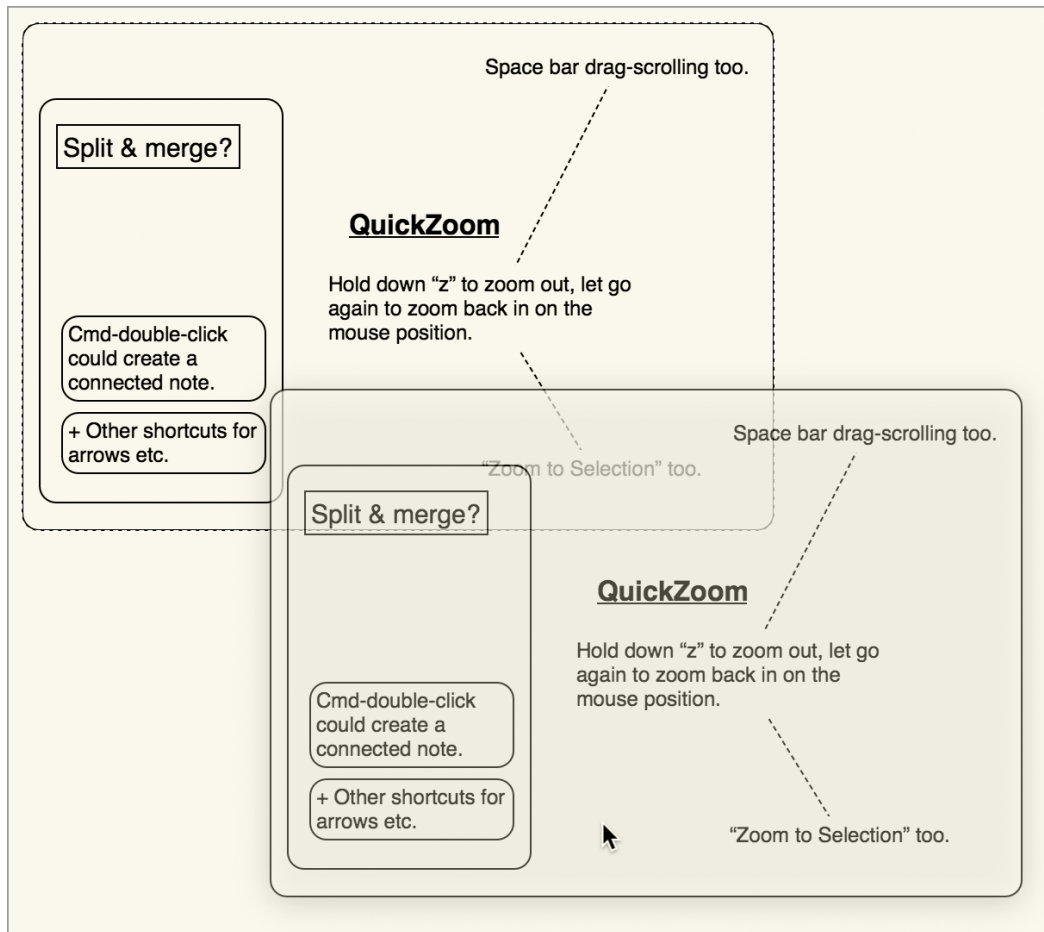

A shape can be set to magnetic whether or not any notes are currently enclosed within it. The setting is a feature of the background shape, not of the notes within it. This means that dragging a magnetic shape beneath a group of notes and then back out again will “vacuum” all of the notes it came in contact with. If you are familiar with digital diagramming and visual outlining software, you might intuitively consider background shapes to be a form of “containment”; that the notes within the shape are somehow *inside* the shape. While true to a very minimal extent, it is better to think of the notes as being *on* the shape. The shape does not own the notes that overlap it, for indeed a note with a “fuzzy” concept might overlap more than one shape.

Dragging a magnetic shape with the **Options** key held down will create a duplicate of that shape and any items overlapping it.

To toggle whether a background shape is magnetic:

1. Select the shape(s) you wish to set to toggle magnetism on.
2. Use the **Notes ▶ Magnetic** (<sup>⌘</sup>M) menu command.
  - If any of the shapes are already magnetic, they will remain so.
  - If all of the selected shapes are in the same state, then they will be toggled on or off together.

**Using Shapes as Handles:** Magnetic background shapes will grab on to any overlapping notes, and as such they do not necessarily need to fully enclose a note to drag it around. Shapes on the other hand do need to be fully enclosed to be dragged along with the larger shape.

**Figure 4.8** When dragging a magnetic shape, the drag “ghost” shows the enclosed notes that will move.

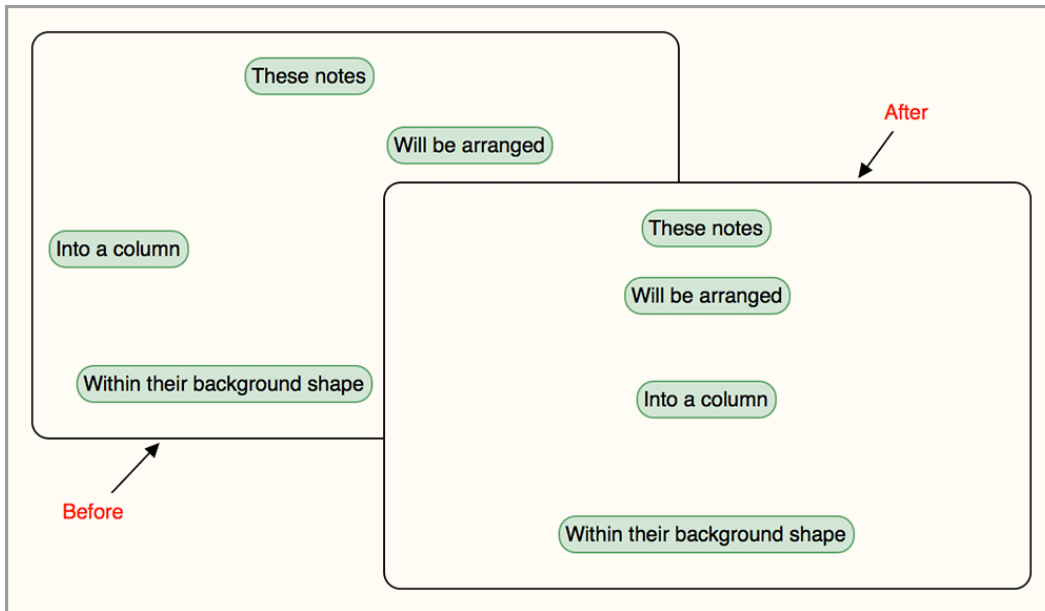

### 4.4.5 Connecting Shapes

Since dragging notes onto shapes is a fundamental task, the ordinary behaviour of dropping one thing onto another to connect them is disabled. However a *shape* can be dropped onto a note (or another shape) to connect the two. Because of this, if you wish to draw an arrow pointing from a note to a shape, then you must start the drag from the shape and hold down the **Option** and **Command** keys together, to draw an inverse arrow.

### 4.4.6 Aligning Notes Within Shapes

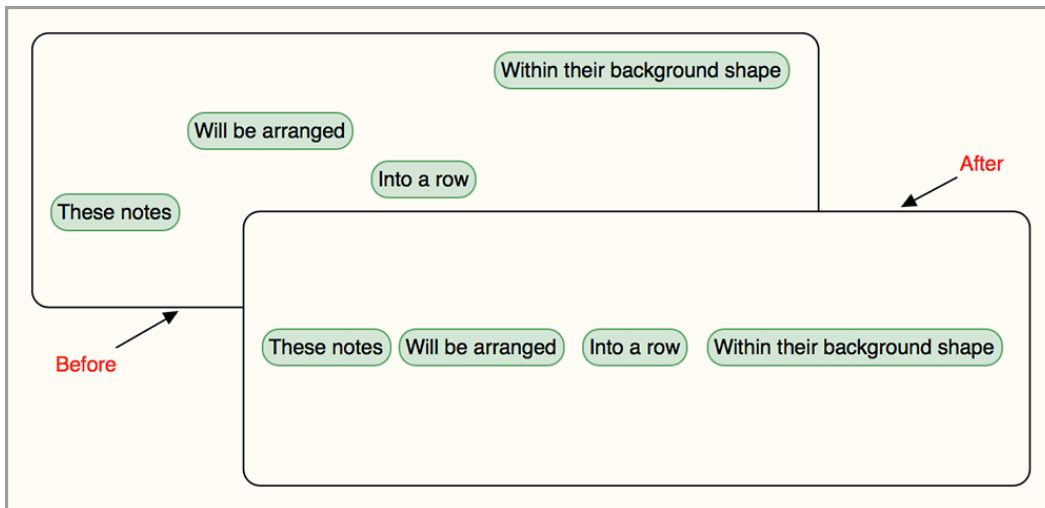

If you’d like to tidy up the notes that are inside of a shape, there are a few menu commands for getting things cleaned up. With the **Notes ▸ Align ▸ Center Horizontally in Background Shape** menu command, you can bring the notes together into

a single column along the middle of the shape (Figure 4.9).<sup>4</sup>

**Figure 4.9** Effects of using the “Center Horizontally in Background Shape” command.

On the other axis, you can bring a selection of notes into a single row along the vertical middle of the shape they overlap (Figure 4.10), with the **Notes ▸ Align ▸ Center Vertically in Background Shape** menu command.

**Figure 4.10** Effects of using the “Center Vertically in Background Shape” command.

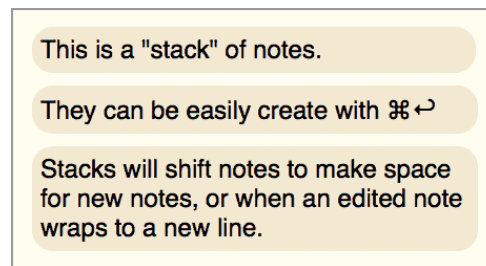

<sup>4</sup> If the note extends over more than one shape then the shape that is at the top of the layering order will be the one it aligns to.

These commands will also work upon shapes themselves, if the shapes are all overlapping one common larger shape. And of course if those shapes are magnetic, they will carry any overlapping notes within them along for the ride.

You cannot align a mix of shapes and notes together, nor can you align selections of notes that overlap two entirely different shapes.

## 4.5 Stacks

Notes can be stacked on top of one another to create “lists”, or columns of text (Figure 4.11). When notes are in a stack, changes to the height of one of the stacked notes will cause the notes in the stack below it to be moved up or down automatically. For instance, if you have three notes in a stack and edit the second one, as you add text to the second note (resulting in it getting taller) the note below it will move down; if you remove text so that the second note becomes shorter, the note below it will move up.

**Figure 4.11** A “Stack” of notes with a background fill to demonstrate placement.

Stacks are useful for maintaining a list of related ideas that don’t belong in a single note. When notes *aren’t* stacked, if you make edits to a note so that it becomes longer, it may begin to overlap notes below it, making it necessary to move things around after you have finished editing. By stacking notes, you avoid this problem, as notes in the stack will move up or down as necessary to avoid any overlap or empty spaces. Additionally, new notes can be created in the middle of the stack, or removed.

### 4.5.1 Creating a Stack

To create a stack from existing notes:

1. Select the notes you wish to arrange into a stack. The first note you select will not move, and subsequent notes will be placed under the first note in order of distance from the first selected note.
2. Choose **Notes ▶ Stack (⌘')**. This command is also available from the contextual menu.

You may optionally at this point wish to use the **Notes ▶ Make Same Width** command to tidy up the stack.

## 4.5.2 Creating a New Note in a Stack

To create a new note in a stack (as well as to create a new stack from scratch):

1. Select the note in the stack underneath which you wish to create the new note.
2. Choose **Notes ▶ New Stacked Note (§ Return)**. The new note will be created beneath the selected note and any notes that were previously below the selected note in the stack will be moved down so that they are now beneath the new note.

## 4.5.3 Deleting Notes in a Stack

To delete notes from a stack, you follow the same procedure as usual for deleting notes ([subsection 4.2.7](#)):

1. Select the notes you wish to delete.
2. Choose **Edit ▶ Delete** or hit the **Delete** key on the keyboard. Any notes below the deleted notes in the stack will be moved up so as to maintain the stack.

## 4.5.4 Moving Notes Out of a Stack

To move a note out of a stack, simply drag it to a different location. When moving notes out of the middle of a stack, any notes below them in the stack will automatically be moved up to remove the gap it would otherwise leave behind, much like when deleting a paragraph of text in a text editor.

## 4.5.5 Moving Notes Into a Stack and Reordering Them

To move an existing note into a stack, simply select the note in the stack that it should appear beneath, then hold down the **Command** key and select the note(s) you wish to add to the stack. Use the **Notes ▶ Stack** menu command to insert the selected notes.

This trick can also be used to reorder notes within a stack. First, select the note the stacked notes should be moved beneath, and then each note you wish to move. Notes will be placed in order using their distance from the initial note, so multiple notes can be gathered together beneath another in this fashion.

### 4.5.6 Indenting Within a Stack

If you are using a stack to create a list of items, it may at times be useful to indent portions of the stack. If you try and move or resize these notes normally, the stack will be broken. Instead, use the dedicated indentation feature, which will block indent the *text* of the note without changing its width or position:

1. Select the notes you wish to indent or outdent.
2. Press **Tab** to indent (or demote) notes by 1cm. Use **⇧Tab** to outdent (or promote) the selected items. Text cannot be outdented beyond the left-margin of the note.

In some cases you will want to resize notes after indenting them, particularly if they were narrow to begin with. While selected, all notes can be resized together ([subsection 4.2.6](#)).

## 4.6 Creating Hyperlinks to Files

Scapple has the capability of adding hyperlinks to ranges of text within notes, and through that ability the files on your computer are as open to you as targets, as locations on the Web.<sup>5</sup>

For many file types, you can simply drag and drop the file you wish to link to into the Scapple board. This will automatically create a new note with text linking to your file.

To manually create a link to a file, follow these instructions:

1. Create a note and type in the title of the link as normal text.
2. Select the text that will become the hyperlink, and use the **Edit ▶ Add Link...** (**⌘K**) menu command.
3. In the text field where the URL will be added, type in the file protocol: “file://” with no spaces after it.
4. Drag and drop the file or folder you wish to link to into the text box. The full path will be printed in as part of the URL.
5. Click the **OK** button.

Now you can click the link to load the item in its native program.

---

<sup>5</sup> Links to the Web use the “http” protocol, and this is why they all start with the prefix “http://”. Another protocol exists which lets you address files on your computer, using a full path to that file.

Part II

# Reference

# **File Management Essentials**

This is the part where we risk trying teach your grandmother to suck eggs—if you know your way around a Mac, you can safely skip this section, as it just covers how to create, open and save Scapple documents (or “Scapple boards”). If you’re familiar with creating, opening, saving and managing files in other applications such as TextEdit, you already know how to do all of this, as Scapple works the same.

## 5.1 Creating a New Scapple Document

Usually you will want to start with a blank Scapple board when embarking on a new project, but sometimes you might want to start your work based on a copy of an existing one.

### 5.1.1 Starting a New Blank Document

1. In Scapple, choose **File ▶ New** (⌘ N).
2. A new window containing a blank canvas will appear. Double-click anywhere on the canvas to start adding notes.
3. When you’re done, choose **File ▶ Save...** (⌘ S).

### 5.1.2 Starting a New Document Based on an Existing Document

On OS X 10.7 and above, Scapple uses the new autosave features built into the operating system. Read more about these features in Using Autosaved Versions of Your Scapple Boards ([section 5.4](#)). Briefly:

1. In Scapple, choose **File ▶ Open...**, and then select the file you want to use as a starting point.
2. Choose **File ▶ Duplicate**. On Mac OS 10.8 you will be prompted for a new name which you can type directly into the title bar of the new window. Holding down the Option key will change this menu command to the more familiar, “Save As...”.
3. Edit the new document that is created.
4. When you’re done, choose **File ▶ Save**. If you haven’t already chosen a name for the new document, you’ll be prompted for one at this time.

On OS X 10.6:

1. In Scapple, choose **File ▶ Open**, and then select the file you want to use as a starting point.

2. Choose **File ▶ Save As...** and choose the file name and location for the new document.

**Creating Templates:** If you have a starter board you anticipate using frequently to create new files, you can select the document in Finder, and use the **File ▶ Get Info** menu command, or **⌘I**. In the “General” section of this palette, you’ll see an option named, “Stationery pad”. When this is enabled, the original document will never be opened directly. Instead a new copy will be created from it automatically.

## 5.2 Saving a Scapple Document

On OS X 10.7 and above, Scapple automatically saves your documents continuously as you work on them, so you don’t explicitly need to save your changes unless you want to name or rename a document. It is still always a good idea to save manually from time to time, though, and you will also want to use Save to specify the location on your hard disk you want to keep the file. Skip to Using Autosaved Versions of Your Scapple Boards ([section 5.4](#)) to read more about it.

### 5.2.1 Save and Name a New Document

1. In Scapple, choose **File ▶ Save....**
2. Name the document, select a location, and then click the **Save** button.

### 5.2.2 Save and Rename a Copy of a Document

On OS X 10.7 and above:

1. In Scapple, choose **File ▶ Duplicate**.
2. Choose **File ▶ Save**.
3. Name the document, select a location, then click the **Save** button.

On OS X 10.6:

1. In Scapple, choose **File ▶ Save As....**
2. Name the document, select a location, then click **Save**.

## 5.3 Opening Existing Scapple Documents

Scapple can only open files created with Scapple. You can recognise a Scapple file by its extension—Scapple files end with the extension “.scap”—or by its Kind, “Scapple Map”. To open an existing document, do one of the following:

- In Scapple, choose **File ▶ Open...**, find and select the document, and then click the **Open** button.
- In Scapple, use the **File ▶ Open Recent ▶** sub-menu, and then choose the document.<sup>1</sup>
- In the Finder, locate the document, and then double-click it or drag and drop the file to the Scapple application icon.

## 5.4 Using Autosaved Versions of Your Scapple Boards

⌘Mac OS X 10.7+ Autosave is only available on OS X version 10.7 and above. If you are running OS X 10.6, you can skip this section.

Scapple automatically saves versions of documents as you work on them. At any time, you can browse through document versions and go back to an older version. You can also explicitly save a version.

A version is saved automatically every hour, or more frequently when you're making many changes. A version is also saved when you open, save, duplicate, lock, rename, or revert a document.

**Taking Care of Versioned Files:** Your Mac will use an advanced feature to save each individual version in such a way that the old copies do not get in your way as visible files. Because this relies upon proprietary Mac technology, versions will be lost forever if the file is transferred to another computer using any method other than Mac-formatting drives. For example, if the file is transferred automatically between computers using Dropbox, the versions will be discarded whenever switching machines. Likewise versions will not survive when e-mailed or transferred via Windows file sharing networks, or when stored on disks that are not formatted with HFS+.

It is therefore recommended that you periodically save separate duplicates of files and keep them safe as backups, especially when using synchronisation tool or collaborating with others. This may already be done if you use Time Machine or another periodic backup system.

### 5.4.1 Browsing, Restoring, Duplicating and Deleting Versions

1. Use the **File ▶ Revert To ▶** sub-menu. From here you could quickly revert to the way the file was when it was opened (with “Last Opened”), or if it has

---

<sup>1</sup> The number of recent documents displayed is configurable via the “General” System Preferences pane on your Mac.

been saved since then, the last time it was saved (with “Last Saved”).

2. Otherwise, select the **File ▶ Revert To ▶ Browse All Versions...** command. The current Scapple board window will be arranged on the left and a stack of windows containing all previous versions will be arranged on the right.
3. Click the tickmarks along the timeline on the right of the screen to browse versions through time. (Or click on the black title bars behind the Scapple window on the right.) Grey marks represent versions stored on your internal hard drive. Pink marks represent versions stored on your backup disk.
4. Do one of the following:
  - To restore your document to a previous version, display the version, then click Restore.
  - To duplicate a version in a new document, display the version, then press the Option key, and click “Restore a Copy”.
  - To delete a version, display the version, hold the pointer to the right of the title, click the arrow, and then choose “Delete This Version”.
  - To delete all versions, press the Option key while holding the pointer to the right of a version’s title, click the arrow, and then choose “Delete Old Versions”.

To leave your document as-is, without changes, click Done.

### 5.4.2 Explicitly Saving Versions

- On OS X 10.8 and above, choose **File ▶ Save**.
- On OS X 10.7, choose **File ▶ Save a Version**.

## 5.5 Moving Scapple Documents

Scapple documents are saved as regular files to your hard disk. The easiest way of moving them to new locations is to use the Finder to copy, cut, paste or drag and drop your files.

If you are running OS X 10.8 and above, you can also move documents using the title bar menu, as follows:

1. Hold the mouse pointer to the right of the document title at the top of the window so that the arrow appears.
2. Click on the arrow to bring up the menu.

3. To move the document elsewhere on your hard drive, select “Move To”, choose a location, and then click “Move”. (Choose “Other...” from the bottom of the list of locations to open the full Save panel.)

**Circumventing File Management:** Care should be taken when using the “Rename” and “Move To” commands from within Scapple, if the files are stored within some form of container, like a database or a Scrivener project. In most cases, the position and name of the file is important to the software that is organising them, and changing either of these parameters can cause the containing software to lose track of your files.

## 5.6 Finding and Locating Scapple Documents

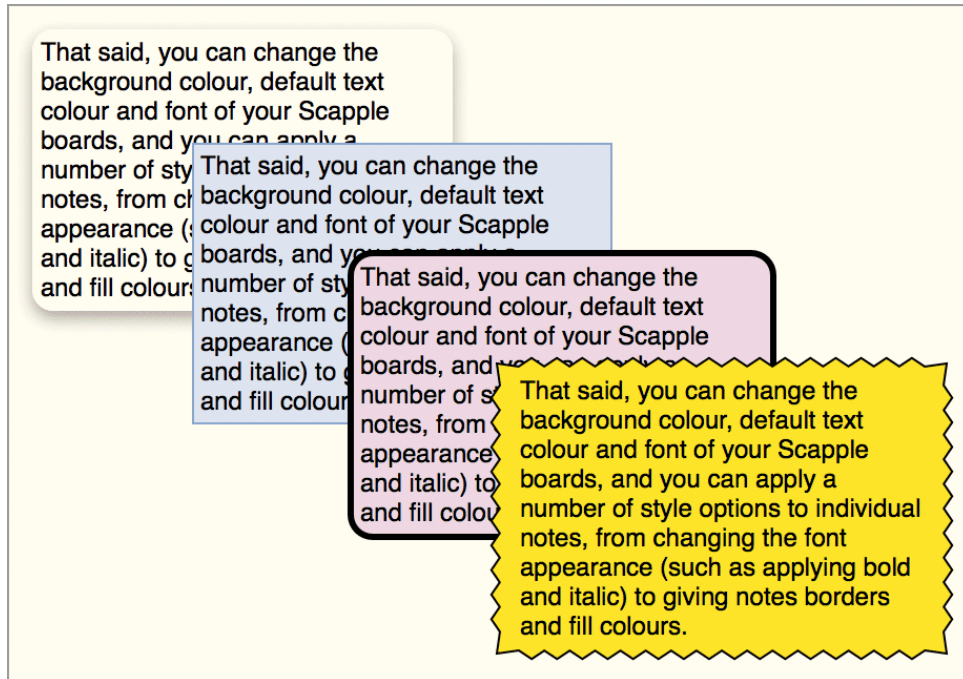

If you aren’t sure where a particular Scapple file is located on your hard disk, there are a couple of ways of finding it:

- If you have the file open in Scapple, or can open it via the **File ▶ Open Recent ▶** sub-menu, then you can right-click or Command-click on the document title (or icon) at the top of the window. This will open a menu showing the path to the file on disk in an ascending order of hierarchy, all the way to the volume or disk it is stored on. Choose the second item from the top in the list, which will be a folder, to open the Finder with the file selected.
- If you don’t have the file open in Scapple and it is not available in the **File ▶ Open Recent ▶** sub-menu, the easiest way to find your files is to use Spotlight. You can either type the name of the document into Spotlight (including the .scap extension for best results), or a snippet of text that you know occurs in the document.
- Using Spotlight to search for “.scap” all by itself will return a list of all Scapple documents indexed by Spotlight. It is important to know that Spotlight can have blind spots—either intentionally imposed by privacy settings, or with some types of removable media.

# **Formatting & Appearance**

6

Scapple is designed to focus on getting ideas down quickly, so it deliberately avoids providing too many distracting bells and whistles that could turn a planning and thinking session into a making-it-look-pretty session.

**Figure 6.1** Just a few of the possibilities available for styling notes.

That said, you can change the background colour, default text colour and font of your Scapple boards, and you can apply a number of style options to individual notes, from changing the font appearance (such as applying bold and italic) to giving notes borders and fill colours.

**Finding These Instructions Confusing?** This section of the guide has been written under the assumption that you already know the basics, as covered in Learning the Ropes ([chapter 4](#)), such as selecting notes, making new ones, and what the differences are between connected notes, stacks, and background shapes. If you haven't already done so, you should go through that chapter. It is brief, and we'll be here waiting for you when you get back.

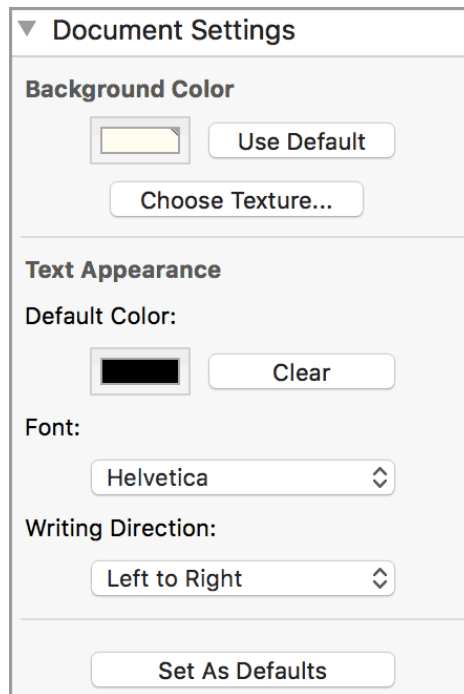

## 6.1 Changing the Appearance of a Scapple Board

By default, new Scapple boards use a beige, vellum-coloured background with black text and connectors. Notes will use the Helvetica font and the writing direction runs from left to right.

All of this can be changed via The Inspector ([chapter 10](#)). For all of the instructions in this section, you will want to open the Inspector to the “Document” section:

1. Open the Inspector by choosing **View ▶ Show Inspector** (**⌘⇧I**).
2. Select the “Document” section in the Inspector.

**Figure 6.2** The “Document” section of the Inspector.

### 6.1.1 Changing the Background Colour

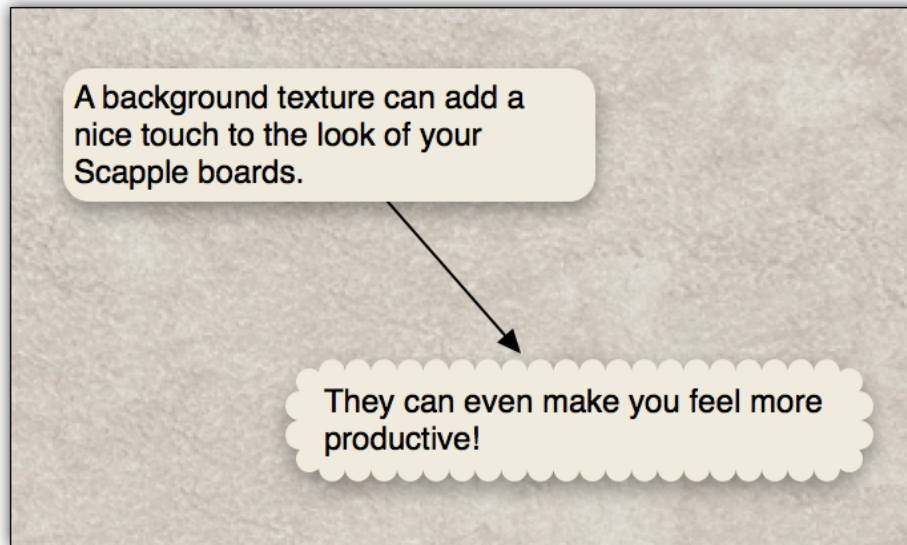

To change the background colour of a Scapple board:

1. Reveal the “Document” section of the Inspector if necessary
2. Click on the colour well in the “Background Color” section to change the background colour of the Scapple board. Note that this will only affect the current Scapple document—each Scapple board can use a different background colour.
3. To reset the background colour to the default beige, click on **Use Default**.

### 6.1.2 Using a Background Texture

If you have a background texture you would like to use (such as graph paper, or wood panelling), follow these instructions to apply the texture to your board:

1. Open the “Document” section of the Inspector.
2. Click the **Use Texture...** button, below the colour selection tool.
3. Use the file browser to locate and select a suitable background texture.

**Figure 6.3** A Scapple board using a leather background texture (no digital sheep were harmed).

A background texture will override any chosen colour for the board (a preview of the texture will be shown in the colour well to signify this). To remove the texture, simply click the **Use Default** button, or choose a colour with the picker. As with a default background colour, this will only change the current Scapple board.

**Choosing a Good Background Texture:** Not every graphic file will make a good texture. The best files are small, and designed to be “tiled”, so that when they are repeated over and over, no visible breaks or seams can be detected (unless that is intentional, such as with a chess board). Larger graphics may be used, but understand that this will both increase the size of the document as well as how much computer memory it must take up to display the board. Large graphics may slow down Scapple and make it difficult to use.

### 6.1.3 Changing the Default Text Colour

The default text colour is used by all notes that don’t explicitly have a colour assigned to them (you can apply a text colour to individual notes using the “Note Format” section of the Inspector to override the default colour for those notes).

To change the default text colour for a Scapple board:

1. Open the “Document” section of the Inspector.
2. Click on the “Default Color” colour well in the “Text Appearance” section and choose a colour from the colour palette that opens. Note that this will only affect the current Scapple board.
3. Click on “Clear” to reset text and connections to whatever will contrast best with the current background colour.

**Creating a dark-themed board:** although you can set the default text to a light colour in conjunction with a dark background, leaving the text colour clear will let Scapple choose black or white, based on the note’s own background colour.

### 6.1.4 Changing the Font Used by Notes

To change the font used by notes in a Scapple board:

1. Open the “Document” section of the Inspector.
2. Choose a font from the “Font” drop-down menu. Note that this will only affect the current Scapple board—each Scapple board can use a different font. The new font will be applied to each note in the Scapple board (notes cannot use different fonts).

**Choosing a Good Font:** Not all fonts support bold and italics, so if bold or italics aren’t available, try choosing a different font. Likewise, if you choose a new font and find that bold and italics get wiped from your document, hit undo (**Edit ▶ Undo** or **⌘ Z**) and try choosing a different font.

Be aware that different fonts have a variety of dimensions, so if you change the font for a Scapple board that already has lots of notes in it, the notes may seem to move around to accommodate the new font (stacks will in fact adjust their positions as necessary). It’s therefore usually better to decide on a font early on in the Scapple board’s gestation.

### 6.1.5 Changing the Writing Direction

Users who write in a language that runs from right to left instead of from left to right can change this via the Inspector (or the **Format ▶ Writing Direction** menu) as follows:

1. Open the “Document” section of the Inspector.
2. Choose “Right to Left” under “Writing Direction”.

Note that the writing direction setting affects the way stacks are detected and the way notes get resized, too, changing everything to work from right-to-left, not just typing.

### 6.1.6 Changing the Default Appearance

If you would rather new Scapple boards use your own preferred appearance settings rather than the default beige background and black text, you can easily set this up via the Inspector as follows:

1. Open the “Document” section of the Inspector.
2. Set up the options for background colour, text colour, font and writing direction as you wish them to be set for the current document and all new documents.
3. Click on the **Set As Defaults** button at the bottom of the inspector.

Whenever you create a new Scapple board by choosing **File ▶ New...**, its appearance will be based on these options.

## 6.2 Note and Shape Style Options

Individual notes (and in some cases, ranges of text within them) as well as background shapes can have their formatting changed in the following ways:

- You can apply bold, italics, underlining or strikethrough to the text of each note. These options can be applied either to whole notes or to ranges of text within notes.
- You can change the text size of each note. Text size changes can only be applied to entire notes, not to ranges of text within notes. Since shapes can never hold text, this setting will be disabled for them.
- You can set the text colour of each note, overriding the default text colour. This setting does not apply to shapes.
- You can apply a coloured border to each note or shape, and choose the thickness of the border.
- The style of the border can be changed to square, jagged, cloud or rounded (which is the default).
- You can choose whether each note or shape has its own background (fill) colour or not.<sup>1</sup>

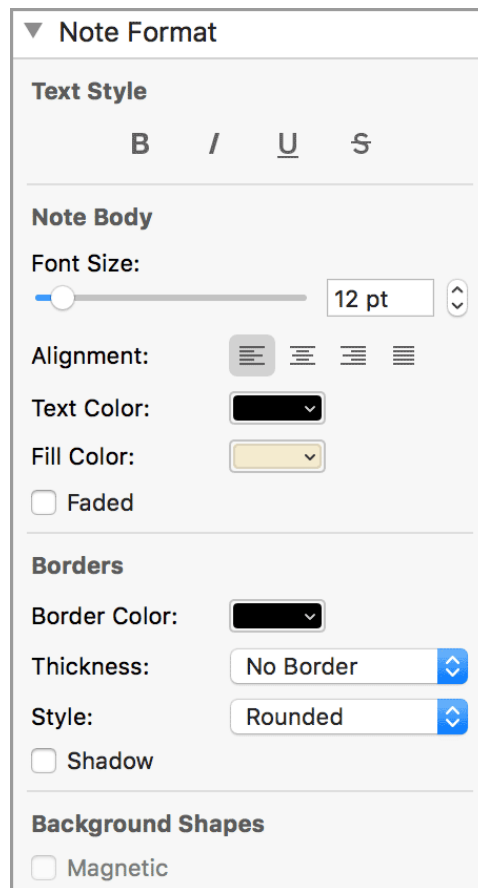

---

<sup>1</sup> Notes will always technically have a fill, rather than being truly transparent. This is to keep the board clean and easy to read when many connection lines intersect beneath a note. When no fill is chosen, the background colour of the board will seamlessly be used.

- You can “fade” notes and shapes, causing them to merge into the background. This can be useful for temporarily taking some notes out of the limelight. When shapes are faded, the notes that are overlapping them will appear faded also. This doesn’t change the state of these notes themselves. If they are dragged out of the shape, they will return to full opacity.

All style changes can be made using the The Inspector ([chapter 10](#)), or various menu commands and keyboard shortcuts. To call up the inspector for changing the note format:

1. Use the **View ▶ Show Inspector** menu command (**⌘I**).
2. Open the “Note Format” section, if necessary.

**Figure 6.4** The “Note Format” section of the Inspector.

See also: Note Style Presets ([section 6.3](#)).

## 6.2.1 Applying Bold, Italics, Underline and Strikethrough

Unlike most other note formatting, the four basic font variations and adornments can be applied to entire notes, or only to selections of text within the note itself.

### Using Boldface

To apply or remove boldface on a note, do one of the following:

- To make whole notes appear in bold, select the notes you wish to affect and choose **Format ▶ Font ▶ Bold** (or hit **⌘B**).  
Alternatively, select the notes you wish to affect, call up the Inspector (**View ▶ Show Inspector** or **⌘I**), ensure the “Note Format” section is visible, and click the “B” button under “Text Style”.
- To apply boldface only to certain ranges of text within a note, first double-click the note to edit it, then select the text you wish to affect.
- To remove boldface from a note, repeat the above process—the Bold command toggles boldface on and off for both text and whole notes.

### Using Italics

To apply or remove italics on a note, do one of the following:

- To make whole notes appear in italics, select the notes you wish to affect and choose **Format ▶ Font ▶ Italic** (or hit **⌘I**).  
Alternatively, select the notes you wish to affect and click the “I” button under “Text Style” in the “Note Format” section of the Inspector.
- To apply italics only to certain ranges of text within a note, first double-click the note to edit it, then select the text you wish to affect.
- To remove italics from a note, repeat the above process—the Italic command toggles italics on and off.

### Using Underlining

To apply or remove underlining on a note, do one of the following:

- To underline whole notes, select the notes you wish to affect and choose **Format ▶ Font ▶ Underline** (or hit **⌘U**).  
Alternatively, select the notes you wish to affect and click the “U” button under “Text Style” in the “Note Format” section of the Inspector.
- To underline only certain ranges of text within a note, first double-click the note to edit it, then select the text you wish to affect.

- To remove underlining from a note, repeat the above process—the Underline command toggles underlining on and off.

## Using Strikethrough

To apply or remove strikethrough on a note, do one of the following:

- To strike through whole notes, select the notes you wish to affect and choose **Format ▶ Font ▶ Strikethrough** (or hit **Shift⌘-**).  
Alternatively, select the notes you wish to affect and click the struck-through “S” button under “Text Style” in the “Note Format” section of the Inspector.
- To strike through only certain ranges of text within a note, first double-click the note to edit it, then select the text you wish to affect.
- To remove strikethrough from a note, repeat the above process—the Strikethrough command toggles strikethrough on and off.

## 6.2.2 Changing the Text Size

To change the text size of selected notes, do one of the following:

- Select the notes you wish to affect and choose **Format ▶ Font ▶ Bigger (⌘+)** or **Format ▶ Font ▶ Smaller (⌘-)**.
- Alternatively, select the notes you wish to affect, call up the Inspector if it is not already visible, then use the slider, text field or stepper under “Font Size” in the “Note Format” section.

Text size can only be applied to an entire note, so even if you are editing the text of the note and select a range of text within it, these commands will still only affect the whole note.

## 6.2.3 Changing the Text Colour of Individual Notes

**How Default Note Colours Work:** The following describes how to set the text colour for individual notes. To set the default text colour used by all notes in a document, see [Changing the Default Text Colour \(subsection 6.1.3\)](#). The default text colour is used by notes that *don't* have a specific text colour set; or, to put it another way, when you apply a text colour to individual notes, as described below, that overrides the default text colour but setting a default colour will not override individual note settings.

To apply a separate text colour to notes, first select the notes you wish to affect, then do one of the following:

- Choose **Format ▶ Colors ▶ Change Text Color...** This will bring up the colour palette, where you can choose the new text colour.
- Click on the “Text Color” colour picker in the “Note Format” section of the Inspector. This will call up a popover with a selection of colours from which to choose, or if you want a custom colour, click on “Show Colors...” at the bottom of the popover to bring up the full colour palette panel.

To clear the text colour from notes so that they use the default, do one of the following:

- Choose **Format ▶ Colors ▶ Clear Text Color**.
- Click on the “Text Color” colour picker in the “Note Format” section of the Inspector and choose the white square with the diagonal red line through it in the popover that appears.

Text colour can only be applied to an entire note, so even if you are editing the text of the note and select a range of text within it, these commands will still only affect the whole note.

### 6.2.4 Applying Borders to Notes & Shapes

Both background shapes and notes can have a variety of border styles applied to them individually, or as defaults. To apply a border to notes or shapes, first select the items you wish to affect (notes and shapes can be selected together, if desired), then do one of the following:

1. Use the **Format ▶ Border ▶** sub-menu to choose a border thickness, or “No Border” to remove an existing border. These options are also available in the contextual (right-click) menu.
2. Choose a border thickness from the drop-down menu at the bottom of the “Note Format” section of the Inspector.

In the supplied figure (Figure 6.5), all six border thicknesses (including none at all) are displayed within the box on the left side. The Inspector is also shown with the “Thickness” drop-down menu enabled and the three pixel border option highlighted.

**Why Doesn’t the Border Thickness Change Immediately?** While a note or shape is selected, the thickness of the border will be intentionally obscured behind the selection halo. This is to increase the clarity of what is selected and not, but has the side-effect of making changes to the selection invisible until that selection is removed.

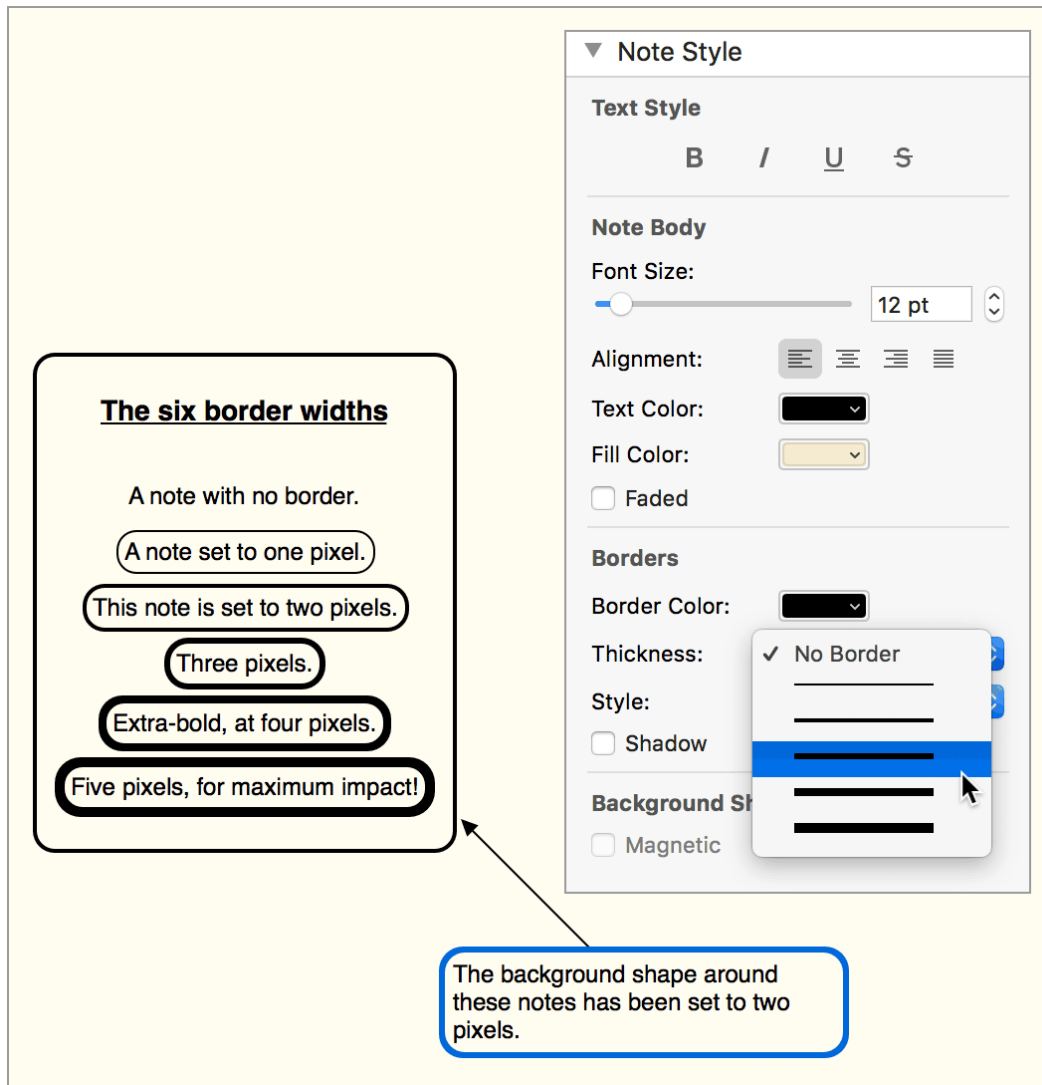

Figure 6.5 A demonstration of the available border thicknesses.

## Changing Border Colours

To apply a colour to the border, first select the items you wish to affect, then do one of the following:

1. Choose **Format** ▶ **Colors** ▶ **Change Border Color...** and use the colour palette panel that appears to set the border colour. Note that if any selected notes do not already have a border, a one-pixel border will be assigned to them automatically.
2. Click on the “Border Color” colour picker in the “Note Format” section of the Inspector and choose a colour from the popover that appears. For a custom colour, click on “Show Colors...” at the bottom of the popover to bring up the full colour palette panel.

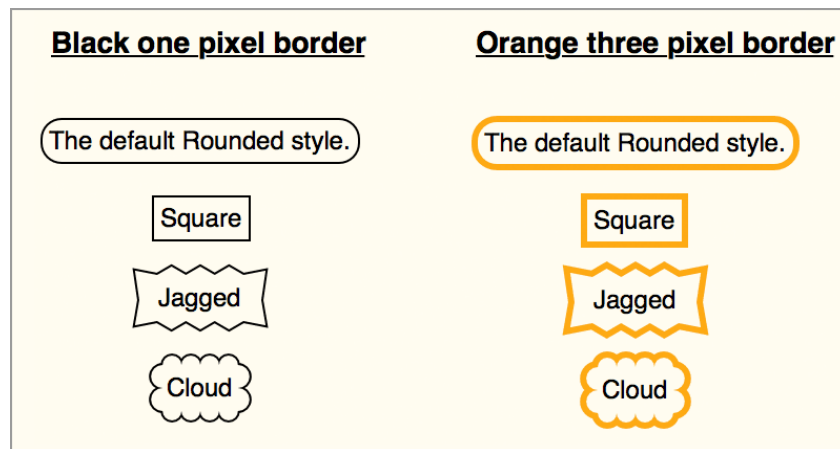

To remove the colour from the border, do one of the following:

1. Choose **Format ▶ Colors ▶ Clear Border Color**.
2. Click on the “Border Color” colour picker in the “Note Format” section of the Inspector and choose the white square with the diagonal red line through it in the popover that appears.

Notes with borders that do not have any specific colour applied will use the default colour set in the respective Preferences ([chapter 11](#)) tab. If there is no default colour set (you have chosen the “no colour” square with the red diagonal bar through it in the colour picker), then the default text colour for the *document* will be used.

If a border colour is added to a note that does not already have a border, the default one-pixel border style will be applied automatically.

## Changing Border Styles

**Figure 6.6** The four available border styles.

To change the style of the border, select the items you wish to affect, then do one of the following:

1. Use the **Format ▶ Border ▶** sub-menu to select from one of the four available options:
  - Rounded (this is the default).
  - Square.
  - Jagged.
  - or Cloud.

This sub-menu is also available from the right-click contextual menu.

2. Use the “Style” drop-down menu in the “Note Format” section of the Inspector to select from one of the four options listed above.

The default border style for notes and shapes can be changed in the application Preferences ([chapter 11](#)).

### 6.2.5 Applying Fill Colour to Notes & Shapes

As with text colour ([subsection 6.2.3](#)), background fill can be applied to individual notes and shapes.

To apply a background fill, first select the items you wish to affect, then do one of the following:

- Choose **Format ▶ Colors ▶ Change Fill Color...** (⇧⌘C) This will bring up the colour palette, from which you can choose the new fill colour.
- Click on the “Fill Color” colour picker in the “Note Format” section of the Inspector. This will call up a popover with a selection of colours from which to choose, or if you want a custom colour, click on “Show Colors...” at the bottom of the popover to bring up the full colour palette panel.

To clear the fill colour from notes so that they use the default, do one of the following:

- Choose **Format ▶ Colors ▶ Clear Fill Color**.
- Click on the “Fill Color” colour picker in the “Note Format” section of the Inspector and choose the white square with the diagonal red line through it in the popover that appears.

Notes and shapes can have a default background fill supplied. To set the application default, use the “New Notes” or “New Shapes” preference tabs ([chapter 11](#)).

### 6.2.6 Fading Notes

Individual notes and shapes can be faded to reduce their visual intensity on the board. This is accomplished by blending the text and shape of the note into the background. As shown ([Figure 6.7](#)), (a) connections among faded notes will follow suit, while (b) connections that join up with any fully visible note will remain clearly visible.

When background shapes are faded, all overlapping items will appear faded as well, making it easy to block out entire groups. This will only impact items within shapes so long as they remain there. If they are dragged off of the shape they will immediately return to full visibility.

To toggle whether the selected notes or shapes are faded, use **Notes ▶ Fade** or **⇧⌘F**. Alternatively, tick the “Faded” checkbox in the “Note Format” inspector section.

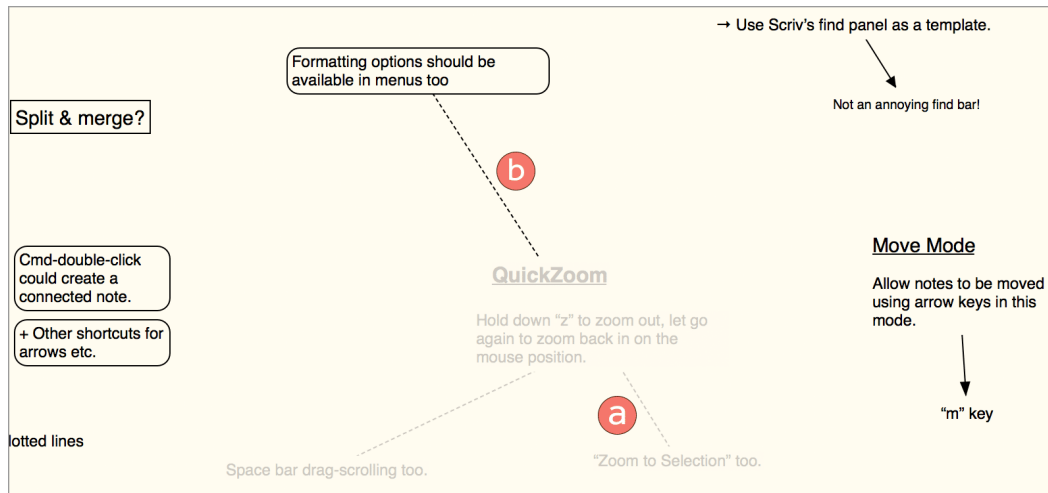

Figure 6.7 The notes in the middle have been faded.

## 6.3 Note Style Presets

Style presets provide a simple way to store and reuse multiple appearance settings on notes and shapes. When you create a new document, a few useful defaults will be provided for you. These can be deleted if you wish, or changed to act in a different way. There are a few important things to be aware of:

- Styles can be best thought of as “macros” or format brushes. They are a set of appearance characteristics that can be applied to selected notes or shapes, and once you do so they are no longer connected to one another. This may seem obvious, but to some who are used to stylesheets in word processors, where changing the style itself will automatically change everything in the document assigned to it, it is worth mentioning. Changing a style after it has been used will *never* go through and change the appearance of pre-existing notes. It will only change how it functions going forward.
- Styles are document specific. Each document you create will likely have its own specific formatting needs. You can freely change and delete styles from this menu without fear of changing other documents. If you would like to import styles from another document you’ve already created, a convenient tool has been provided for doing so: **Format ▶ Note Style ▶ Import Note Styles....**  
You can change these default styles in “General” Preferences ([chapter 11](#)), by opening a document with the styles you want to use henceforth, and clicking the **Set From Current Document** button.
- As you might have already picked up, styles are applicable to both notes and background shapes. If you use a style that contains characteristics specific only to shapes (like magnetism), it will simply be ignored by notes.

Likewise, shapes will ignore all settings pertaining to text formatting.

### 6.3.1 Using Styles

To apply styles to notes or shapes:

1. Select the items you wish to apply the style to using whatever method you prefer.
2. Use one of the following methods to apply a style to the notes:
  - Use the **Format ▶ Note Style ▶ Apply Note Style ▶** sub-menu to select the style.
  - Right-click on any of the selected notes to bring up the contextual menu with its handy “Apply Style” sub-menu.
  - In the “Note Styles” section of the Inspector, click on the style you wish to apply.
  - Use an assigned keyboard shortcut ([subsection 6.3.6](#)) to assign styles directly with no further ado.

New notes can be created with a style already applied by dragging and dropping a style out of the “Note Styles” section of the Inspector into any blank area of the board.

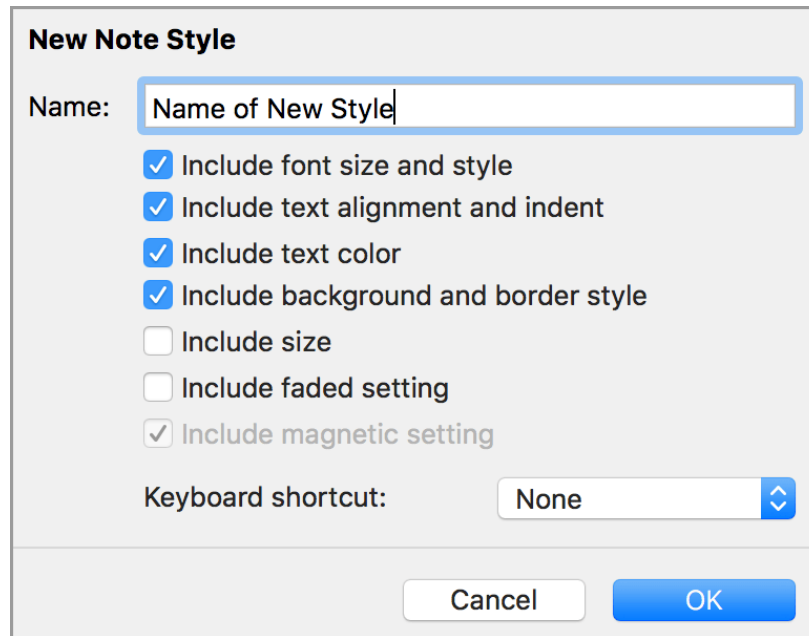

### 6.3.2 Deleting Styles

Styles can be deleted from the **Format ▶ Note Styles ▶ Delete Note Style ▶** sub-menu, or by right-clicking on the style in the “Notes Styles” section of the Inspector, and choosing the “Delete Note Style” command. As mentioned before, this will not impact any notes you’ve already created. It will only remove the style from the list. If you’ve used that style before, you can always get it back by selecting a note that used that style in the past, and creating a new style from it.

### 6.3.3 Creating Styles

Styles are created by selecting the single note or shape you wish to use as a prototype for the appearance, and then using the **Format ▶ Note Styles ▶ New Note Style from Selection** menu command, or by dragging the style into the “Note Styles” section of the Inspector (avoiding any existing styles when dropping). This will bring up an option panel ([Figure 6.8](#)).

**Name** The name that you provide will be used in all of the menus and in the “Note Style” Inspector section.

**Figure 6.8** The “New Note Style” panel.

**Include font size and style** The font size and any characteristics such as bold, underscore or strikethrough will be saved in the style. The font family cannot be saved, because Scapple documents only use one font per document.

Cases where ranges of text within the note have been styled will be ignored. This only applies when the whole note has been set to a format, like italic. This setting is ignored by shapes.

**Include text alignment and indent** Text alignment, as set in the **Format ▶ Alignment ▶** sub-menu will be preserved, as well as the indent level of the text. See Indenting Within a Stack ([subsection 4.5.6](#)).

This setting is ignored by shapes.

**Include text color** The note’s text colour will be saved in the style.

This setting is ignored by shapes.

**Include background and border style** Both the background fill and the border type (including thickness, colour and style) will be saved into the style.

**Include size** For notes, this will save the width of the note. For shapes, both the width and the height will be saved. This is off by default.

**Include faded setting** When **Format ▶ Fade** has been applied to the selection, it will be saved. This is off by default.

**Include magnetic setting** When **Notes ▶ Magnetic** has been set for a shape, it will be saved into the style. This setting is ignored by notes.

**Keyboard shortcut** Select a keyboard shortcut to assign to this particular style. You will be able to apply this style to selected notes by using this shortcut at any time. Those shortcuts already in use by other styles will be marked for your convenience, but if you wish to override an existing assignment to the new style you can do so after confirming a dialogue.

### 6.3.4 Updating and Renaming Styles

Changing the formatting stored in the style, as well as its name are both done in the same way:

1. Select a note that represents what you would like the style to be changed to (making a new temporary note if necessary).  
Alternatively, if you just wish to rename the style, you should select a note that has identical formatting (again, making a temporary note and applying the style first, if necessary).
2. Use the **Format ▶ Note Style ▶ Redefine Notes Style from Selection...** menu command, or drag and drop the example note onto the style you want to update in the “Note Styles” section in the Inspector.
3. The same panel used to create new styles will be presented (Figure 6.8). If all you wish to do is rename the style, type in the new name and click the **OK** button. You can also modify the scope of what the style changes, if you wish.

### 6.3.5 Importing Styles

Styles can be imported from existing Scapple documents. By default, doing so will not update or overwrite any of the existing styles in your document, even if they share the same name. If two styles share a name, they will generate duplicate entries in the menu (refer to the prior section for renaming styles).

To import styles from another existing Scapple document:

1. In the document you wish to import the styles *to*, use the **Format ▶ Note Style ▶ Import Note Styles...** menu command.
2. This will bring up a file chooser. Locate the Scapple document you wish to import the styles *from*, and click the **Open** button.  
If you wish to completely overwrite the existing styles in the document with the imported ones, then confirm the option, “Overwrite existing note styles with imported styles”. You will be asked for confirmation of doing this after clicking the **Open** button.

Alternatively, if both Scapple documents are open at once and you only want to copy a few styles over:

1. Open the inspector panel in both document windows, with their Styles sections expanded.
2. Drag and drop the styles from one pane into the other to add them to the target document.

### 6.3.6 Adding Keyboard Shortcuts to Styles

For styles that you use frequently, you may wish to add a keyboard shortcut to them. This can be easily done by right-clicking on the style in the “Note Styles” section of the Inspector and using the “Change Keyboard Shortcut” sub-menu.

You will also be able to modify or add a shortcut when updating the style normally ([subsection 6.3.4](#)). Use the “Keyboard shortcut” setting at the bottom of the style setup pane.

**|Navigation**

---

There are several convenient ways of getting around in a Scapple document, which will become more useful once the board grows to be larger than your screen can comfortably display.

**QuickZoom (Z)** QuickZoom acts a bit like **View ▶ Zoom to Fit**, but only while the “Z” key is held down. When the key is released, the zoom will snap back to its original level, with the location you are pointing at with your mouse scrolled into view.

So long as the key is held down you can manipulate existing notes, moving them around and drawing connections between them.

**Drag-Scrolling** If you’ve ever used an illustration or photo manipulation program, you may be used to holding down the spacebar and holding down the left mouse button to drag the canvas around. You’ll be pleased to know that this works in Scapple as well.

**Option-Zooming** If the **Option** key is held down, the scroll-wheel on your mouse (or equivalent gesture on the trackpad) will zoom the view in and out.

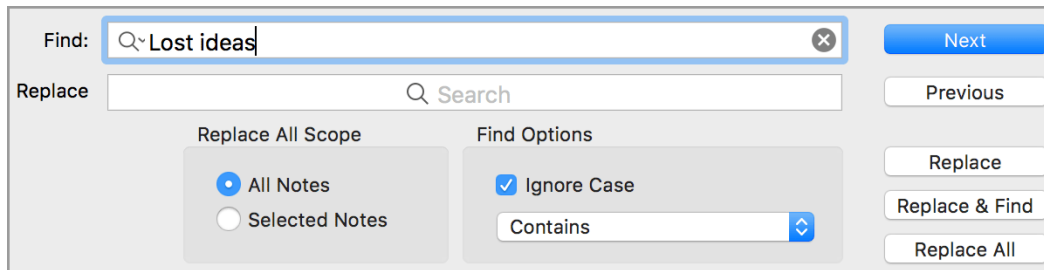

**Arrow Key Selection** When movement mode ([subsection 4.2.4](#)) (press **M** to toggle) is disabled, the four arrow keys on your keyboard will jump from one note to the next where possible.

**Searching** It’s one of those common-sense things that almost does not require mention, but using the standard **Edit ▶ Find ▶ Find...** (**⌘F**) command to search for a key phrase can also be used for navigation. Consider that you can create notes strictly to serve as “anchors”, or titles, around larger clusters in the board. In a very large board with several such anchors, if you give them all a common prefix, the “Find Next” shortcut, **⌘G**, could come in handy for quickly jumping from one cluster to the next. Read more about Searching in Scapple ([chapter 8](#)).

# Searching in Scapple

As your Scapple documents grow larger, finding text you have written will become more important, especially if the board is much larger than the screen can legibly show. The facility for finding text will be familiar to anyone who has used a text editor before. You can use the basic **Edit ▸ Find ▸ Find...** (**⌘F**) panel (Figure 8.1) to type in the word or phrase you are looking for, step through search results, and make incremental or global replacements.

**Figure 8.1** The standard text find panel.

When text is located, it will briefly flash yellow to help draw the eye to it, and then it will be highlighted for editing. If you used the **Return** key to initiate the find, the panel will be dismissed and you will be placed in editing mode with the phrase selected for you. When the text you are searching for is located off-screen, Scapple will automatically scroll the board so that the match is displayed.

It is possible to continue incrementally searching through the document even with the Find panel closed, with **Edit ▸ Find ▸ Find Next** (**⌘G**), or in the opposite direction with **Edit ▸ Find ▸ Find Previous** (**⇧⌘G**).

**Finding Other Instances of Selected Text:** If you have a word or phrase you would like to search for already selected, there is no need to copy it, open the Find panel and paste it into the search field. Simply hit **⌘E** to load the phrase into the Find panel silently, and then **⌘G** to locate the next instance.

The Find panel contains the following options:

**Replace All Scope** When using the **Replace All** button, the available options here will determine the scope used for the replace. “All Notes” is the default. Every match will be changed to what is typed into the “Replace” field. If “Selected Notes” is enabled, then only those notes you have selected will be considered for replacement.

**Find Options** Disable “Ignore Case” if you require case-sensitive searching. The drop-down menu below this option contains four options:

- *Contains*: this is the default. Searches will match even partial phrases. So searching for “stal” may return “stalwart” as well as “stall”. Only the portion that matches will be selected.

- 
- *Starts With*: the phrase will only match if the word starts with the text typed into the search field.
  - *Whole Word*: use this option to avoid cases where the phrase might exist as a component of other words.
  - *Ends With*: the phrase will only match if the word ends with the text typed into the search field.

The action buttons along the left are as follows:

- *Next*: finds the next instance of the text in the search field.
- *Previous*: returns the previous match.
- *Replace*: replaces the currently selected text and then waits for your command.
- *Replace & Find*: replaces the currently selected text and automatically jumps to the next search result.
- *Replace All*: replaces every instance of the search text with the contents of the “Replace” field (even if it is empty), within the selected replace all scope.

# **Import, Exporting & Printing**

Scapple makes it easy to bring in existing notes and to export your work for use in other applications or for sharing with other people.

## 9.1 Getting Work Into Scapple

Bringing existing notes and files into Scapple is all done using drag and drop—there is no dedicated “Import” menu.

### 9.1.1 Importing Existing Notes

Scapple can read the following text file types:

- .txt
- .rtf and .rtfd
- .doc
- .docx
- .odt

To import text files of these types, simply drag them from the the Finder and drop them onto your Scapple document.

- If you drop multiple files, they will be added to the document in a stack.
- If you import a single file, you will be asked if you wish to split it into multiple notes. If you tick the “Split into multiple notes separated by:” option, you can then tell Scapple which characters should be sought as representing the division between notes. For instance, entering two return characters here (which is the default) will cause Scapple to go through the document and split off new notes wherever it encounters an empty line.

**Just the Text, Ma’am:** Note that only the text (with basic formatting) is imported—images, tables and suchlike will not be retained.

It is also possible to drag in selections of text from most word processors. Simply select some text in Scrivener, Microsoft Word, Pages or TextEdit and drag it directly onto your Scapple document.

### 9.1.2 Importing Images

Importing images works exactly the same way as importing text files—all you need to do is drag image files from the Finder onto your Scapple document. Their default width will conform to that supplied in the preferences ([chapter 11](#)). Images, like shapes, can be resized from any angle, and they will always retain their original aspect ratio.

### 9.1.3 Adding MathType Equations

If you have MathType (from [Design Science](http://www.dessci.com)<sup>1</sup>), you can easily add equations to Scapple and edit them. If MathType is installed, you will see **Edit ▶ Insert MathType Equation...** added to the menu system. Selecting this will launch MathType, allowing you to create an equation. When you close the equation editor window in MathType, the equation will appear in Scapple. You can then double-click on the equation to launch MathType again and edit the equation.

Both images and equations are treated as normal notes for most purposes. They can be styled and connected to other notes.

## 9.2 Getting Work Out of Scapple

There are several ways to get your work out of Scapple and into other programs. The **File ▶ Export ▶** sub-menu is the most obvious, with the most widely-useful export format perhaps being PDF, but these are far from the only choices.

### 9.2.1 The Order of Things

Before exploring the export possibilities, an important note on exporting to text formats is in order. Scapple is at its most fundamental level a freeform application: notes can be written anywhere; connections can be made all over the place, forming loopy circles and Möbius strips. There is thus no logical order of notes for Scapple to walk through when exporting to linear formats such as single text files. Neither is there any inherent hierarchy that Scapple can use as a basis for working out the best order in which to export notes.

As a result, Scapple can only make educated guesses at how to best order the notes when exporting to linear formats. (Imagine seven notes connected in a circle, another seven notes forming another circle nearby, with two of the notes from each circle connected to one another. Only a human could take these notes and lay them out in a meaningful linear order, basing the new arrangement on the content of the notes—something Scapple, as an uncomprehending agglomeration of zeroes and ones, has no chance of achieving.) Scapple makes its educated guess as follows:

- It goes through the notes from left-to-right, top-to-bottom (or right-to-left if that is the writing direction of the document).
- If a group of notes are stacked, they will be exported in stack order.
- Whenever it comes to a note that is connected to another note, it walks through all of the connections.

---

<sup>1</sup> <http://www.dessci.com>

- If two or more notes are connected to a note, it starts with the one that is nearest.
- If a note is connected to more than one other note, it is only included the first time it is encountered in this traversal process.
- Once Scapple finds no more connections in the current cluster, it continues scanning across the document.
- In text file formats that support hierarchy, such as OPML, background shapes become enclosing groups; in other text formats, they are ignored.

For simple arrangements of notes, this traversal process can work very well. For more complicated arrangements, however—even moderately complicated ones—you may find that the order of the notes in the exported text file is not at all what you intended—and Scapple sadly has no access to your intentions.

Often, therefore, it may be better to export the document to PDF format and copy and paste the notes from the PDF document into a text document in the order you require. For instance, you could import the PDF file into Scrivener, have a text document open alongside it in a split view, and copy and paste between the two. Read more about Integration with Scrivener ([section 9.5](#)).

## 9.2.2 Export Formats

Scapple can export your work to files, using the formats described in Available Export Formats ([Table 9.1](#)).

As explained in The Order of Things ([subsection 9.2.1](#)), Scapple can only make an educated guess at the best way to order the notes when exporting to linear text files. This means that for all formats except PDF and PNG, you may need to rearrange the notes in an external editor to achieve the order you want.

To export to one of these formats, choose the appropriate option from the **File ▶ Export** menu. For most formats, you can choose whether to export all notes or only those that are currently selected.

The options available for each format are detailed below.

### Export Format Options

When you choose one of the formats available in the **File ▶ Export** menu, a Save panel appears, allowing you to choose where on your hard disk the exported file should be saved. Depending on the format you selected, the Save panel may also contain options that allow you to customise the appearance of the exported file, or to choose what is included.

**Table 9.1** Available Export Formats

Format	Uses
PDF	Perhaps the most useful format, since it can be opened almost anywhere, shows the document exactly as it appears in Scapple, and allows you to select and copy the text of notes.
PNG	Useful if you want to produce a simple image file from your Scapple document.
Plain Text (.txt)	Produces a simple plain text file that can be opened in any text editor. You can choose how the notes are separated.
Rich Text (.rtf)	Produces a rich text file that can be opened in most word processors (including Microsoft Word). You can choose how the notes are separated. Note that images are not included when exporting to the RTF format.
Rich Text with Attachments (.rtfd)	Produces a rich text file that includes images. You can choose how the notes are separated. RTFD files can be opened by most Mac text programs, including Pages and TextEdit. (Microsoft Word cannot open RTFD files.)
Plain Text List (.txt)	Produces a simple plain text file with each note separated by a single line break. This format is the best one to choose if you wish to open the file in a spreadsheet such as Numbers or Microsoft Excel.
Outline Markup (.opml)	Produces a file in the Outliner Processing Markup Language format, which can be opened by many outlining programs (such as OmniOutliner). Background shapes are exported as groups.

## PDF

File ▶ Export ▶ PDF... (⇧⌘E)

**Draw background and use default text color** If ticked, the PDF document will look exactly the same as your Scapple document, using the same background and text colour; if deselected, the PDF will not include a background colour (and will thus appear white) and will use black text as the default (although notes that have had their text colour changed specifically will remain in that colour).

**Draw faded notes at full opacity** If ticked, the “Fade” setting that can be applied to notes is ignored in the PDF file and all notes will appear fully opaque.

## PNG

File ▶ Export ▶ PNG...

There are no options available when exporting to the PNG format. The PNG created will be a faithful representation of how your Scapple document looks on-screen. (If you require a higher resolution, it is better to export to PDF.)

## Plain Text

File ▶ Export ▶ Plain Text (.txt)...

**Export selected notes only** If ticked, only the notes that are currently selected in your Scapple document will be included in the generated file; otherwise, all notes are included.

**If no extension is provided, use “.txt”** If ticked, the “.txt” extension will be appended to the file name, and even if you type a custom file extension, OS X will prompt you to use “.txt” instead. Deselect this if you wish to export using a different file extension (e.g. “.md”).

**Separator** Notes in the exported file will be separated by whatever characters you enter in the “Separator” text field. If you leave the field blank, notes will be separated by an empty line.

## Rich Text Formats

File ▶ Export ▶ Rich Text (.rtf)... and File ▶ Export ▶ Rich Text (.rtfd)...

**Export selected notes only** If ticked, only the notes that are currently selected in your Scapple document will be included in the generated file; otherwise, all notes are included.

**Separator** Notes in the exported file will be separated by whatever characters you enter in the “Separator” text field. If you leave the field blank, notes will be separated by an empty line.

### Plain Text List

**File ▶ Export ▶ Plain Text list (.txt)...**

**Export selected notes only** If ticked, only the notes that are currently selected in your Scapple document will be included in the generated file; otherwise, all notes are included.

### Outline Markup

**File ▶ Export ▶ Outline Markup (.opml)...**

**Export selected notes only** If ticked, only the notes that are currently selected in your Scapple document will be included in the generated file; otherwise, all notes are included.

**Create notes field** When this option is selected, the full text of each Scapple note will be saved as an OPML “note”. The first few characters (fifty, or up to the first line break, whichever is the shortest) will be used for the “heading” of the outline element. When this option is deselected the entire text of the Scapple note will be saved into the element headline. This produces a more compatible result, as not all OPML readers will detect a note field as well as a headline field. If you are unsure, just leave this option deselected, or experiment with which option works best with whichever outlining application you use.

## Exporting images

If you have dragged images into your Scapple document, you can export them by selecting **File ▶ Export ▶ Images...** Ticking “Export selected notes only” in the export panel will cause only the images that are selected in your Scapple document to be exported. Otherwise, all images in the document will be exported. (This option is unavailable if the Scapple document does not contain any images.)

### 9.2.3 Copy and Paste

Along with dragging files into Scapple and using **File ▶ Export** to get your ideas out, you can also use copy and paste to bring notes in and out.

— Bringing work into Scapple using copy and paste:

1. Select some text in another program and copy it (**⌘C** or **Edit ▶ Copy** in most applications).
2. In Scapple, right-click where you want the text placed and select “Paste” from the contextual menu. (Alternatively, just hit **⌘V** or use **Edit ▶ Paste**, and the note will appear somewhere in the top-centre of the view.)

3. If you wish to split the imported note into several smaller notes, double-click on it to edit it, place the cursor where you would like to split it, and use the **Notes ▸ Split** (⌘⌘K) option.

This is a great way of quickly bringing in text from other open applications.

— Getting work out of Scapple using copy and paste:

1. In Scapple, select the notes you wish to take to another program.
2. Hit ⌘C or go to **Edit ▸ Copy** (or use “Copy” in the contextual menu).
3. Open the other program and paste at the location you would like the copied notes to appear (in most Mac programs, the “Paste” option appears in the Edit menu and has the keyboard shortcut ⌘V). The text of the notes will be pasted with an empty line between each note. This will work in any program that can read either plain or rich text from the OS X pasteboard, including Scrivener, Microsoft Word, Pages, Mail, TextEdit and most other applications that can edit text. (If only a single image note is copied, it can also be pasted into image programs such as Preview.)

## 9.3 Printing Scapple Boards

To print your Scapple document, select **File ▸ Print....** This will bring up macOS’s standard print panel. Here, along with the usual options such as the number of copies that should be printed and which printer to use, you will find several Scapple-specific options that allow you to determine how your document should be printed.

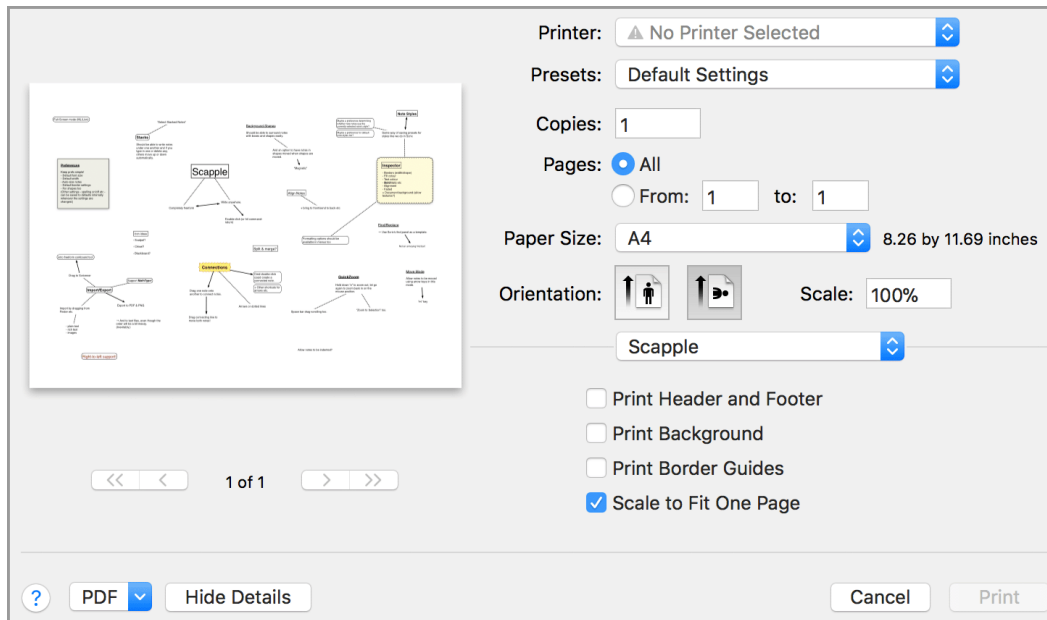

If you don’t see any options, be sure to click on the “Show Details” button ([Figure 9.1](#)). This will expand the print panel so that the preview is displayed on the left and the printing options are shown on the right.

On the top-left, you’ll see all the options that you would expect to find in any program—the paper size and orientation, the scale to use, and so on.

Below that, if “Scapple” is selected in the pop-up button that appears just over half-way down the printing panel (it should be selected by default), you will see four extra options. These are described below.

**Print Header and Footer** If selected, a basic header and footer will be added to printed pages, showing the name of the document, the date and time, and the page number.

**Print Background** If selected, the background of the document is printed. In general, unless you want a full-colour print-out that includes the background colour or texture, it is best to leave this deselected when printing.

**Figure 9.1** Standard Mac OS X print panel, showing Scapple settings in the lower-right.

**Print Border Guides** If selected, a dotted line is printed to show where the page borders begin. This is most useful when “Scale to Fit One Page” is turned off so that the document is printed across multiple pages. The dotted lines then serve to show you where to cut if you want to tape together a large print-out of your document.

**Scale to Fit One Page** If selected, the document will be printed on a single page (the scale percentage is ignored in this case). If deselected, the document will be printed across as many pages as are required to accommodate the current scale percentage (as set in the text field next to the Orientation setting).

### 9.3.1 Working with Printed Page Guides

When working for print as your output, you may frequently have need for a display which shows you where one sheet of paper will end and another will begin. The **View ▶ Page Guides** menu command will toggle the visibility of this grid, making it easy to avoid page breaks while working.

The page grid will be drawn in accordance with the document’s print settings (established in **File/Page Setup...**). It should be noted that the non-printable area of a page will not be depicted by the grid. This can mean that notes will appear further from the edge of the paper, than they might from the grid line.

## 9.4 Transferring Notes Between Scapple Boards

Transferring notes between different Scapple documents is easy: you can either copy and paste them or drag them across.

### 9.4.1 Using Copy and Paste to Transfer Notes Between Scapple Documents

1. Select the notes you wish to transfer to another Scapple document.
2. Select **Edit ▸ Copy** or hit **⌘C**. (Alternatively, if you wish to remove them from the original document, use **Edit ▸ Cut** or **⌘X**.)
3. Open the other Scapple document.
4. Right-click on the location you would like the notes to appear and select “Paste” from the contextual menu. (Alternatively, use **Edit ▸ Paste** or just hit **⌘V** to have the notes pasted somewhere central in the viewed area.)

### 9.4.2 Dragging Notes Between Scapple Documents

1. Select the notes you wish to transfer to another Scapple document.
2. Ensure the other Scapple document is open alongside the original.
3. Drag the selected notes from the original across to the other document, releasing the mouse button at the location you wish the notes to be placed.
4. If you wish to remove the notes from the original document, return to that document and hit the **Delete** key.

**A Note on Font Sizes:** When transferring notes to another Scapple document, all connections between the dragged notes are maintained and the notes retain all of their appearance options. However, if the two documents use different fonts, the transferred notes may not be optimally sized since they were created using a font with different metrics, and overlapping may occur. Stacks can be reset by select the entire stack and using **Notes ▸ Stack (⌘')**.

## 9.5 Integration with Scrivener

As you’d expect, given that Scrivener is our writing software package, it’s easy to move notes between Scapple and Scrivener. The general assumption is that Scapple is the place you hash out ideas in their very early stages, and when Scapple’s toolset has helped you work out where you want to go, you take those ideas

into Scrivener for further development. But it's easy enough to go the other way, too, and bring notes from Scrivener into Scapple so that you can play with them in a more freeform environment.

Here are some simple ways of incorporating Scapple into your Scrivener workflow (or vice versa).

### 9.5.1 Dragging Ideas from Scrivener into Scapple

A separate note will be created in Scapple for each dragged document. The created notes will contain the titles and synopses of the Scrivener documents that were dragged in, and if dragging from a freeform corkboard, they will be placed in the same relative positions as the cards in Scrivener. Items can be dragged from the Binder sidebar, Outliner or Corkboard editor views in the order that they appear in Scrivener.

#### Dragging from a Freeform Corkboard

1. In Scrivener, select the folder containing the notes you want to import in the binder.
2. Switch to corkboard mode, so that you see the documents as cards on the corkboard.
3. Switch the corkboard to freeform mode (using the segmented control in the footer bar).
4. In the freeform corkboard, select the documents you wish to import into Scapple.
5. Drag the documents from Scrivener's freeform corkboard into your Scapple document.

### 9.5.2 Dragging Notes from Scapple into Scrivener

1. In Scapple, select the notes you wish to import into Scrivener.
2. Drag the notes into Scrivener's binder or Scrivener's freeform corkboard (notes can only be dragged into the corkboard if it is in freeform mode).

If notes are dragged into the freeform corkboard, they will maintain the same relative positions they had in Scapple. When dragged into the binder, Scapple will make an educated guess at the best order to use (see [The Order of Things \(subsection 9.2.1\)](#)). Fortunately, it's very easy to rearrange items in Scrivener's binder, so if the notes aren't in the order you would like, you can simply drag them into the correct order once imported.

### 9.5.3 Importing Your Scapple Document into Scrivener as a PDF

If you just want to reference the network of ideas you have created in Scapple while writing in Scrivener, a good approach is to generate a PDF file and bring that into Scrivener, as follows:

1. In Scapple, go to **File ▶ Export ▶ PDF...** (⇧⌘E) and save the PDF file to disk.
2. Locate the PDF file in the Finder and drag it into Scrivener's binder (remember that you cannot place PDF files into Scrivener's "Draft" folder, though).

Alternatively:

1. Ensure that Scrivener is open and that the project you wish to import your Scapple notes into is the frontmost project.
2. In Scapple, go to **File ▶ Print...** (⌘P) to bring up the Print panel.
3. In the lower-left of the Print panel, click on the "PDF" button and select "Save PDF to Scrivener" from the menu that appears.<sup>2</sup>

A PDF version of your Scapple document will be placed as the last item in the "Research" folder of the frontmost Scrivener project.

Once your PDF file is imported into Scrivener, you can split the editor and refer to your Scapple PDF alongside your writing.

### 9.5.4 Importing Your Scapple Document into Scrivener As-Is

Instead of importing your Scapple document into Scrivener as a static PDF file, you can simply drag the .scap file itself into Scrivener's binder (placing it anywhere except in the Draft folder). On OS X 10.7 and above, you can then view the Scapple document as a Quick Look preview inside Scrivener (on 10.6 it will appear as a linked file, because the Quick Look preview is not available on systems earlier than 10.7). Then, use the "Open in External Editor" feature of Scrivener to open and edit the version of the Scapple document that is now stored inside your Scrivener project.

---

<sup>2</sup> Consult the Scrivener documentation on installation if you do not see this option and have purchased Scrivener from the Mac App Store.

**|The Inspector**

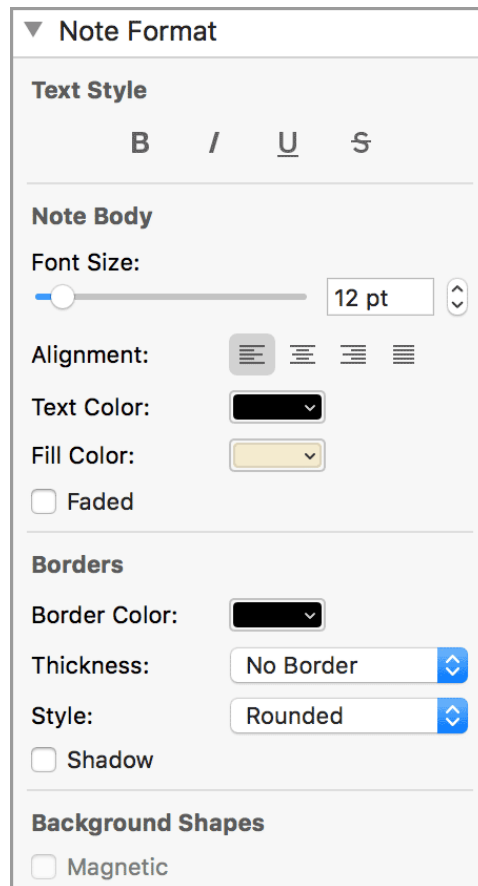

**10**

The Inspector allows you to customise the appearance of individual notes and background shapes as well as of the document as a whole. It comprises two panes: “New Note” and “Document”, which are detailed below. Many of the options available in the Inspector are also available in the Format menu, although the options in the “Document” section appear nowhere else.

Each section of the Inspector can be collapsed out of the way to clean up the sidebar. Click anywhere within the “Note Format”, “Note Styles” or “Document” section headers to expand or collapse the associated settings.

## 10.1 Note Format

The “Note Format” section provides options for editing the appearance of notes and background shapes.

**Figure 10.1** The “Note Format” section of the Inspector.

**Text Style** Allows you to apply bold, italic, underline or strike-through formatting to the text of a note. If whole notes are selected, the formatting is applied to the entire text. If a range of text is selected within a note while it is being edited, the formatting is applied only to the selected range. These

options are also available in the **Format ▶ Font ▶** sub-menu (and can be applied using standard keyboard shortcuts).

**Font Size** Determines the font size of selected notes. (The default font size for new notes can be set via the Preferences. The font face itself is set via the “Document” section of the Inspector, since Scapple documents are limited to using a single font face.) The font size can also be increased or decreased using the **⌘ +** and **⌘ -** keyboard shortcuts or the **Format ▶ Font ▶** sub-menu.

**Text Color** Determines the text colour of selected notes. The text colour can also be changed via the **Format ▶ Colors ▶** sub-menu. (The text colour used by notes that do not have a colour set explicitly can be set via the “Document” section of the Inspector. Thus, for instance, if you want a blue document background with white text for all notes, it would be most efficient to set this via the “Document” section of the Inspector, rather than by using “Text Color” in the “Note Format” section, which is better for applying a *different* colour to the standard note text colour.)

**Alignment** Determines the text alignment of selected notes (left, centred, right or justified). These options are also available via the **Format ▶ Alignment ▶** sub-menu. (The default alignment for new notes can be set via the Preferences.)

**Fill Color** Determines the fill colour of selected notes. The fill colour can also be changed via the **Format ▶ Colors ▶** sub-menu. (The default fill colour for new notes can be set via the Preferences.)

**Faded** Determines whether or not the selected notes should be semi-transparent. Also available in the Format menu. (The exact level of transparency can be set via the Preferences.)

**Border Color** Determines the border colour of selected notes. The border colour can also be changed via the **Format ▶ Colors ▶** sub-menu. (The default border colour for new notes can be set via the Preferences.)

**(Border) Thickness** Determines how thick the borders of selected notes are. The border thickness can also be changed via the **Format ▶ Border ▶** sub-menu. (The default border thickness for new notes can be set via the Preferences.)

**(Border) Style** Determines the style of border used by the selected notes (“round”, “square”, “jagged” or “cloud”). The border style can also be set via the **Format ▶ Border ▶** sub-menu. (The default border style for new notes can be set via the Preferences.)

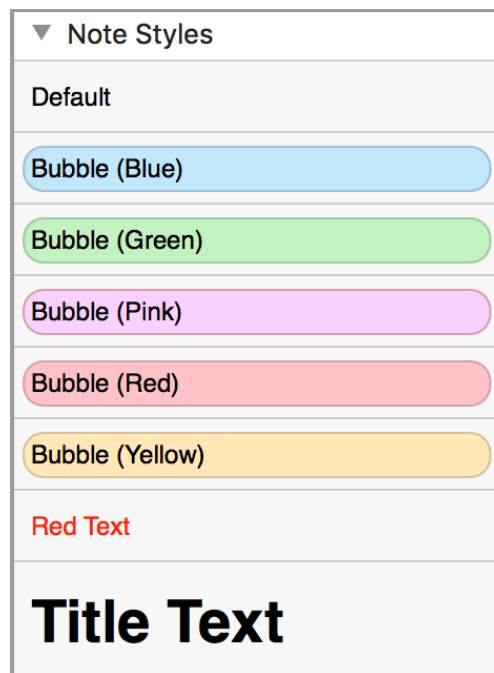

**Shadow** Determines whether a shadow should be drawn around selected notes. This can also be set via the Format menu. (Whether or not new notes have a shadow can be set via the Preferences.)

**Magnetic** (Only available for background shapes) Determines whether or not selected background shapes are “magnetic”. If a background shape is magnetic, then when it is moved, any notes that overlap it are also moved. If it is not magnetic, then when it is moved, overlapping notes remain where they are. This option is also available in the “Notes” menu, and the default setting for new background shapes can be set via the Preferences.

## 10.2 Note Styles

The “Note Styles” section displays all of the note styles that have been saved into the current document. It can be used to quickly apply a style to selected notes, create new notes with that style, to create, and update existing, styles.

Each style will be listed in alphabetical order and will demonstrate the appearance that will be applied to notes using that style (Figure 10.2).

**Figure 10.2** The “Note Styles” section of the Inspector.

Using the style pane is simple, and designed to work in a similar fashion to how you use Scapple itself. Here is how you can work with styles and notes with this pane:

**To Apply a Style to Selected Notes** Select the notes you wish to format and click on the style in the style pane.

**To Apply a Style to One Note** Drag and drop a style onto a note to apply the style to *just* that note, even if there are several notes selected.

**To Create a New Note from a Style** Drag and drop a style onto the board in a blank area. This will create a new note where you drop it.

When dragging and dropping, if notes are already selected on the board, then the typical modifier keys used to link to new notes are all applicable ([subsection 4.2.1](#)).

**To Create a Style from a Note** You can create new styles by dragging an exemplar note into the style pane between other styles (or onto the “Default” entry at the very top, if you’re finding that difficult to do). When dragging, make sure no other style is highlighted and rather the entire style pane acquires a blue rectangular border. Upon drop, you will be presented with a dialogue for setting up the new style, as documented in Creating Styles ([subsection 6.3.3](#)).

**To Redefine a Style from a Note** Drag and drop a note (if you try to drag multiple notes into this pane nothing will happen) onto a style directly to change that style so that it matches the dropped note. This will bring up the dialogue for redefining styles, as documented in Updating and Renaming Styles ([subsection 6.3.4](#)).

There are a few management features available by right-clicking on styles in the pane:

**Redefine Note Style...** The selected note on the board will be used to modify the style’s store formatting. As with the drag and drop method, it will bring up the style settings panel.

**Change Keyboard Shortcut** Quick access to the keyboard shortcut list. If all you want to change about a style is its shortcut, this is the best way to do it.

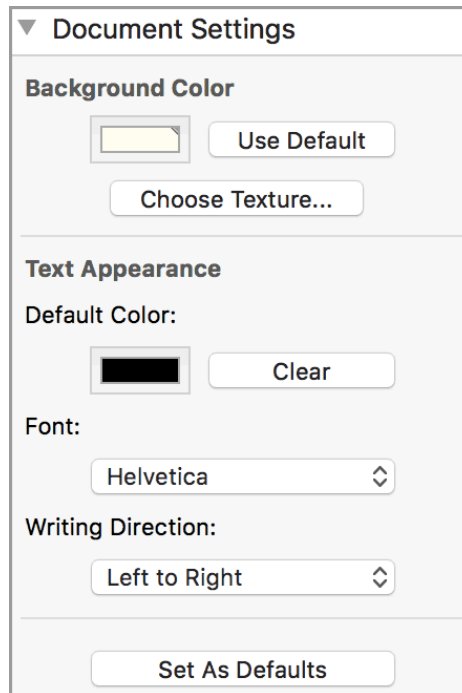

**Delete Note Style** Removes the style from the board’s style list. This will have no impact on any notes using the formatting it applied.

## 10.3 Document

The “Document” section provides options for determining the general appearance of the document (and for setting the default appearance of new documents).

### 10.3.1 Background Color

Clicking on the colour well brings up the colour palette, allowing you to set the background colour of the document. The **Use Default** button resets the background to Scapple’s default off-white.

**Figure 10.3** The “Document” section of the Inspector.

Alternatively, click on **Choose Texture** to select an image file from disk to be used as a background texture. Background texture images are tiled (that is, repeated over and over), so you should only use images with repeating patterns. Images selected for use should be small to avoid performance issues—we recommend nothing over 512x512 pixels, but a small file size is equally important. There are many great tiling textures available on the internet.

### 10.3.2 Text Appearance Options

**Default Color** Clicking on the colour well brings up the colour palette, allowing you to set the default colour of the text in new *and existing* notes. The colour set here will be used by all notes in the document that have not had a text colour set explicitly via the “Note Style” section or Format menu. Clicking on “Clear” will get rid of the default text colour, in which case the default text of notes will be whatever contrasts best with the current document background colour.

This setting is also used for the colour of connecting lines between notes.

**Font** Determines the font face of notes in the current document. Each Scapple document can only use a single font face (although the text size can vary between notes, and text can be formatted using bold, italics, underline and strikethrough). In general, it’s best to choose the font face when you first create the document rather than much later when you have a complicated arrangement of notes, because different font faces have slightly different

metrics, and changing the font can cause notes to get resized and shift around.

**Writing Direction** Determines whether text in the document is left-to-right or right-to-left. This also determines whether stacks are defined by the left or right edges of notes, and the order in which notes are processed when exporting to text formats.

**Set As Defaults** Clicking the “Set As Defaults” button causes all of the settings in the “Document” section of the Inspector to be set as the defaults for new documents.

Part III

# Appendices

# | Preferences

1

1

Application settings allow you to make global changes to the way the software works. Open the Preferences panel by selecting the **Scapple ▶ Preference...** menu command.

The panel has three tabs: “General”, “New Notes” and “New Shapes”. The “General” tab allows you to determine a variety of application-wide behaviours, while the “New Notes” and “New Shapes” tabs allow you to set up the default appearance and behaviour of new notes and background shapes.

**Adjusting Defaults for Documents:** To set the default board colour, text colour, font and writing direction for new documents, use the **Set As Defaults** button in the “Document” section of the Inspector. To avoid clutter and keep settings to a minimum, these options are not duplicated. Likewise, a number of options in the interface are inherently carried over as defaults for newly-created documents. For instance, when you turn spell-checking on or off via the **Edit ▶ Spelling and Grammar ▶** sub-menu, the setting you choose will be used as the default for new documents.

## 11.1 General

Options available in the “General” Preferences tab are as follows:

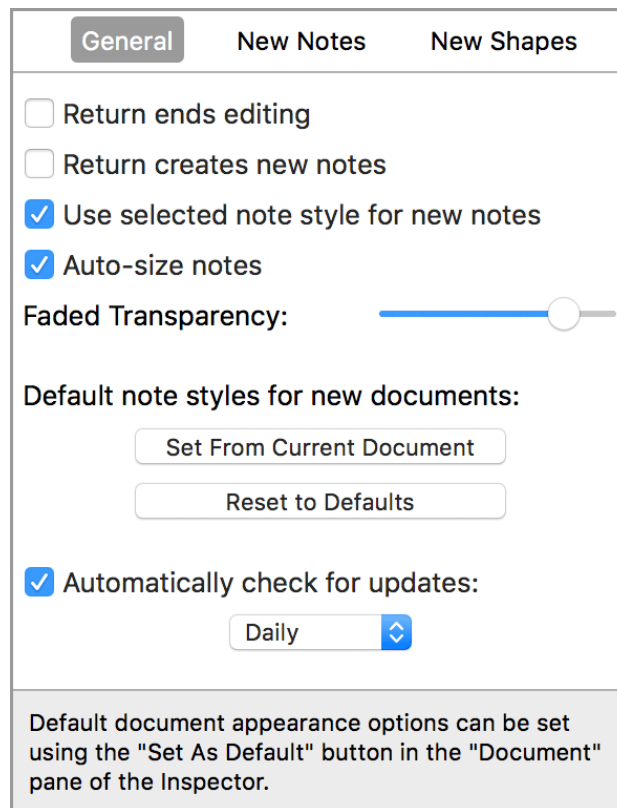

Figure 11.1 The “General” tab.

**Return ends editing** If selected, when editing a note, hitting Return will cause editing to end and the focus to return to the main Scapple view. If this is not selected, then Return will add carriage returns to your notes, and you will need to use the Esc or Enter keys to end editing.

**Return creates new notes** If selected, when the main Scapple view has the focus (i.e. when you are not editing a note), hitting Return will create a new note, exactly as hitting **⌘Return** does. If this is deselected, then hitting Return will begin editing the currently-selected note.

**Use selected note style for new notes** When ticked, if notes are selected (highlighted with a selection border) when you create a new note, the new note will look the same as the first-selected note in the selection. For instance, if you select a note that has a yellow background and a jagged border, then create a new note, the new note will likewise have a yellow background and a jagged border. If this option is deselected, new notes always use the default appearance options as set in the “New Notes” pane of the Preferences.

**Auto-size notes** If ticked, when you finish editing a note, if the note is composed of one or more lines that are shorter than the default note width (as determined in the “New Notes” Preferences tab), the note width will be adjusted to snugly fit the text.

**Faded Transparency** This slider determines the visibility of notes that are set to be faded. If the slider is all the way to the left, the note will be almost entirely opaque; if all the way to the right, the note will be nearly invisible.

**Default note styles for new documents** Allows you to determine the set of note styles that appear in the **Format ▶ Note Style ▶ Apply Note Style** menu for new documents. Clicking **Set From Current Document** will take the note styles of the frontmost Scapple document and archive them for use in new documents. This set of note styles (as they were at the time this button was clicked) will then appear in the note style menu in new documents created using **File ▶ New....** Clicking **Reset to Defaults** will reset the note styles used for new documents to those that are provided with Scapple by default.

**Automatically check for updates** **<Direct-Sale Only>** If this is checked, whenever Scapple is launched it will check the website to see if there is a newer version available and, if so, will ask you if you want to update. Note that if you do not have this checked, you can still check for updates by choosing the **Scapple ▶ Check for Updates...** menu command.

The drop-down menu beneath this option governs how frequently Scapple will check for new versions. If you want to stay on top of the latest updates, “Daily” is generally good enough, but if updating frequently is disruptive to your work habits, you can set this to check by week or month.

## 11.2 New Notes

The “New Notes” pane determines the default appearance of newly-created notes. After notes have been created, their appearance can be edited using the Inspector or Format menu.

General	New Notes	New Shapes
Default text:		
		New Note
Default font size:		
		12 pt
Default width:		
		200 pt
Default alignment:		
		Left
<input type="checkbox"/> Fill Color		
		White
Border:		
		No Border
Border Style:		
		Rounded
Border Color:		
		Black
<input type="checkbox"/> Shadow		
<p>Default document appearance options can be set using the "Set As Default" button in the "Document" pane of the Inspector.</p>		

Figure 11.2 The “New Notes” tab.

**Default text** Determines the placeholder text that will appear in newly-created notes. This can be left empty if you do not wish new notes to contain placeholder text.

**Default font size** Determines the default font size for new notes. (The font itself is set in the “Document” section of the Inspector.)

**Default width** Determines the width of new notes. (Notes can be resized after they are created, and if “Auto-size notes” is ticked in the “General” Preferences tab, new notes may automatically be shrunk to fit.)

**Default alignment** Determines the default text alignment of new notes. (The alignment of individual notes can be changed via the Inspector or Format menu after they are created.)

**Fill Color** Determines the default fill colour for new notes. (The fill colour of individual notes can be changed via the Inspector or Format menu after they are created.)

**Border** Determines the default border thickness for new notes. (The border of individual notes can be changed via the Inspector or Format menu after they are created.)

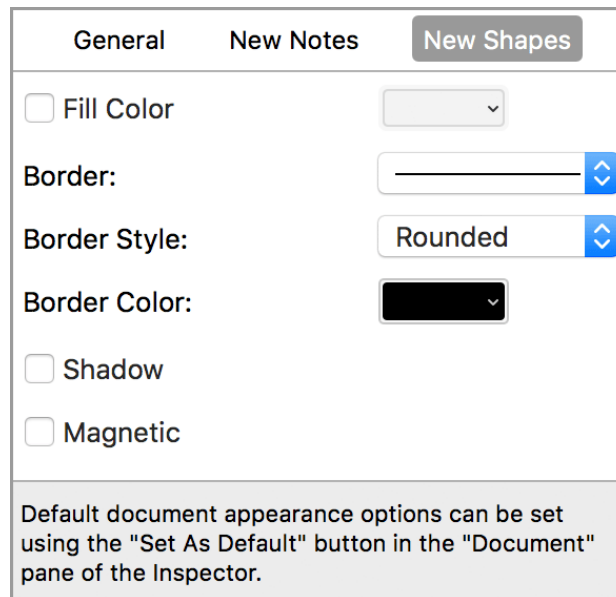

**Border Style** Determines the default border style for new notes. (The border style of individual notes can be changed via the Inspector or Format menu after they are created.)

**Border Color** Determines the default border colour for new notes. (The border colour of individual notes can be changed via the Inspector or Format menu after they are created.)

**Shadow** Determines whether new notes have a shadow or not. (This setting can be changed for individual notes via the Inspector or Format menu after they have been created.)

## 11.3 New Shapes

The “New Shapes” pane determines the default appearance of newly-created background shapes. After background shapes have been created, their appearance can be edited using the Inspector or Format menu.

**Figure 11.3** The “New Shapes” tab.

**Fill Color** Determines the default fill colour for new background shapes. (The fill colour of individual background shapes can be changed via the Inspector or Format menu after they are created.)

**Border:** Determines the default border width for new background shapes. (The border of individual background shapes can be changed via the Inspector or Format menu after they are created.)

**Border Style** Determines the default border style for new background shapes. (The border style of individual background shapes can be changed via the Inspector or Format menu after they are created.)

**Border Color** Determines the default border colour for new background shapes. (The border colour of individual background shapes can be changed via the Inspector or Format menu after they are created.)

**Shadow** Determines whether new background shapes have a shadow or not. (This setting can be changed for individual background shapes via the Inspector or Format menu after they have been created.)

**Magnetic** Determines whether new background shapes are magnetic or not—that is, whether notes that overlap them are carried along whenever they are moved. (This setting can be changed for individual background shapes via the Inspector or Notes menu after they have been created.)

# **Menus & Keyboard Shortcuts**

12

This appendix will list most of the available menu commands along with their keyboard shortcuts, a short description of what the command does, and a cross-reference to further documentation on the feature if one is available. It is thus useful as a topical table of contents.

## 12.1 Scapple Menu

The main application menu contains integration tools with other software, application management, information and preferences.

**About Scapple** Display the credits and version information.

---

**Preferences (⌘,) Application preferences** allow you to alter aspects of how the software looks and feels. Read Preferences ([chapter 11](#)) for more information on what can be changed.

**Registration <Direct-Sale Only>** If you are using the demo version of Scapple and decide to purchase it, use this menu command to input the registration serial name and number and activate the software. Read Registration ([section 3.2](#)) for more information.

If the software is already registered, this will show your serial name for reference.

**Check for Updates... <Direct-Sale Only>** The software can be set to check for updates automatically in the “General” preference tab ([section 11.1](#)). If you have disabled this or just wish to check before the next scheduled check, this menu command will force an update check. When updates are available, you will be walked through the automatic update process. Read Application Updates ([section 3.3](#)) for more information on this topic.

---

**Services** Services are how different programs on your Mac can communicate with one another. For example, if you have Scrivener installed, and are editing the text of a note, you can send a selection of text to Scrivener via this menu.

---

**Quit Scapple (⌘Q)** Quits the software, closing all windows. On Mac OS X 10.7+, windows will normally be saved automatically as they are closed, and re-opened for you when you start Scapple again. On 10.6, you will be prompted to save any documents with pending changes.

**Quit and Keep (Close) Windows (⌘⇧Q)** <Mac OS X 10.7+> When holding down the **Option** key, this alternate menu command will appear. Whether this displays “Close” or “Keep” windows depends upon your system preferences to reopen projects that were open on quit, thus allowing you to temporarily override the default. This will not change your preference; it only impacts the one time you quit.

## 12.2 File Menu

Contains commands for managing documents (Scapple boards), as well as moving data in and out of them via import, export and printing. This section will list the all of the available commands on Mac OS X 10.7 or greater, marking those that will not appear on 10.6.

**New (⌘N)** Immediately creates a new blank Scapple board to work on ([section 5.1](#)). Your work will begin autosaving immediately to a temporary file, on 10.7+, until it is given a name and location to be saved to.

**Open... (⌘O)** Open an existing Scapple board from the disk ([section 5.3](#)). You can also load documents by double-clicking on them in the Finder, or dragging them to the Scapple icon.

**Open Recent** ▶ Select from the previous Scapple documents you have worked on. This is a rotating list, which means that over time older documents may fall off the list. Additionally the list can at times be wiped with system or software updates. If you are unsure of where a missing document has gone, read Finding and Locating Scapple Documents ([section 5.6](#)). The number of items listed in this sub-menu is governed by OS X’s global preference, which can be set in the system “General” preference pane (“Appearance” on Mac OS X 10.6).

---

**Close (⌘W)** Immediately closes the current Scapple document, automatically saving when doing so. With unsaved documents, and on 10.6 in general, you will be prompted to save each board as necessary. When holding down the **Option** key, this menu command will become “Close All”. All open documents will be simultaneously closed, though the software will continue running until you quit it.

**Save... (⌘S)** On Mac OS X 10.7, this menu command will be named, “Save a Version...”. This is fundamentally identical to the action that is taken on 10.8+, the label has merely been simplified. Read more about autosave and version features in Using Autosaved Versions of Your Scapple Boards ([section 5.4](#)).

On 10.6, autosave is not available and thus neither is versioning. Saving the board will merely overwrite the old copy on the disk in a standard fashion. Time Machine, if set up properly, may still record incremental changes by the hour.

**Duplicate / Save As...** (⌘⌘S) On 10.7+ this will be labelled as “Duplicate”. It will create a new copy of the document in a new window which can then be saved to a new file. On 10.8, holding down the **Option** key will alternate this command to “Save As...”, which will work in the traditional fashion.

On 10.6, “Save As...” follows the traditional mechanism for automatically creating a new copy of the document and saving the changes to it. The original document will not receive any of the unsaved changes at that point. Moving forward you will be working in the new document, allowing you to leave a “trail” of revisions behind you.

**Rename...** <Mac OS X 10.7+> Allows you to rename the document without closing it, changing the name in Finder, and then re-opening it.

**Move To...** <Mac OS X 10.7+> A convenience feature to move the document to a new location without closing it, moving it in Finder, and then re-opening it from the new location.

**Revert To ▶** <Mac OS X 10.7+> When the word “Edited” appears after the name of the document in the title bar, this menu will display the last saved version in a sub-menu. Alternatively you can select **File ▶ Revert To ▶ Browse All Versions...** to bring up the Mac’s autosave version interface.

**Export ▶** This sub-menu provides a number of different formats that you can use to export your ideas into a format that is more suitable for working in other programs, or as a graphic file rendering of the map. On account of Scapple’s freeform design, the order in which notes appear must at times be guessed at. There is no internal order or hierarchy to make use of. That said, clusters of notes connected together and notes overlapping a background shape together will prefer to stick together, as well as stacked notes.

Read more about the available formats in Getting Work Out of Scapple ([section 9.2](#)).

---

**Prevent Editing** Toggles a lock on the board so that it can no longer be changed.

---

**Page Setup...** (⌘⌘P) Set up the paper size and page settings for printing to either PDF files or to paper using a printer. This makes no impact on the size of the board itself, merely how the board will be chopped up into paper sized pieces.

**Print... (§P)** Send the Scapple board to your printer (you can optionally save as a PDF as well, using the standard Print dialogue). Maps that are larger than a single sheet of paper can either be scaled to fit, or automatically sliced into paper sized chunks, so that they can be taped together. Read more about Printing Scapple Boards ([section 9.3](#)).

## 12.3 Edit Menu

The “Edit” menu concerns itself primarily with the manipulation of text, but also contains commands for passively working with notes and shapes (e.g. selecting notes, or finding them). For active manipulation of these, the “Notes” menu is a better bet ([section 12.5](#)).

**Undo & Redo (§Z / ⇧§Z)** Undoes or redoes the changes made to the document in the order they were made. Undo will step backward in the change list, and redo will return forward. If changes are made after undoing, the redo history will be erased. Most actions that can be taken in Scapple can be undone.

Editing a note’s text enters an isolated state where undo and redo will only act upon the edits made to the text. Once you finish editing, the overall undo and redo history will be returned to seamlessly.

**Cut, Copy and Paste (§X / §C / §V)** Cut, copy and paste act fundamentally as they do in other applications.

- When working with notes in a Scapple document, all of the notes in the selection will be acted upon. You can use these commands within the same board, or from one board to another.
- Pasting notes into another text editor will place the text content of the notes, including any inline formatting if the target editor is compatible with rich text.
- When editing text, the commands work as you would expect them to in any text editing application.
- Read Copy and Paste ([subsection 9.2.3](#)) for more information on how notes and text can be copied, cut and pasted.

**Delete delete** Permanently removes the selected notes or shapes from the board. This action can be undone.

---

**Arrow Keys Move Notes (M)** Toggle between Movement Mode ([subsection 4.2.4](#)) and selection mode. Movement mode lets you “nudge” notes with the keyboard arrows, while selection mode will attempt to select

notes in the direction of the arrow press. Use the Shift key to increase how much distance a note is moved by, and Shift with Command to increase the speed even further.

---

**Select All (⌘A)** When editing text, all of the text within the current note will be selected. Otherwise, all of the notes on the entire board will be selected, even if they are not currently visible.

**Select ▸** This sub-menu provides a number of convenience methods for selecting notes. Read more about Selecting Notes ([subsection 4.2.2](#)) and Selecting Shapes ([subsection 4.4.2](#)).

**Notes Stacked Below (⇧⌘A)** Selects the remainder of the notes in the current stack, starting from the selected note down. If multiple notes within the stack are initially highlighted, the entire stack will be selected.

**Notes Overlapping Selected Shapes (⇧⌘A)** Applicable only when one or more background shapes are selected. All notes overlapping these shapes will be added to the selection. You may also hold down the **Option** key and click in the background area of the shape to perform this action. **⇧⇧click** allows multiple shapes *and* their overlapping notes to be incrementally added to the selection.

**Connected Notes (⇧⌘A)** All notes *directly* connected to the currently selected note(s) will be added to the selection. Consequently, chaining this command will allow you to incrementally broaden the selection to those note's connections, and onward.

**Connected Clusters (⇧⇧⌘A)** Fully selects all notes directly and *indirectly* connected to the currently selected note(s). Thus, note “Alpha” connected to note “Beta” which is in turn connected to note “Gamma” will all be selected if this command is used on any of the notes.

**Invert Selection (⇧⌘I)** Flips the selection state for the entire board. All items that were selected will be removed from the selection, and all items not selected will be added.

**Deselect (⌘D)** All notes will be deselected. This can also be done by clicking anywhere on the background, but in cases where a background shape is filling the entire view, this command will properly deselect everything for you.

---

**Insert MathType Equation...** Inserts a MathType image equation as a new note in the centre of the current view. If MathType is not properly installed, this menu command will be hidden.

**Add/Edit Link... (⌘K)** Applicable only when editing the text of a note. While editing text, the menu command will read “Add Link...”. You may then copy and paste the URL into the provided dialogue box to add a hyperlink to the selected text.

When a link is selected (or even if the cursor is currently within the span of the hyperlink), the menu label will read, “Edit Link...”. This will bring up the dialogue box so you can edit the target URL of it.

---

**Find ▶** Provides general tools for finding text that has been typed into notes. Read Searching in Scapple ([chapter 8](#)) for more on using the search features.

**Find... (⌘F)** Brings up the standard “Find” panel. This will locate text that has been typed into notes, scrolling the view if necessary to locate the note it resides within. Finding text within a note results in being pulled into editing mode, so you can start typing or editing the text immediately.

**Find Next (⌘G)** Finds the next occurrence of the last text you searched for, using the search parameters you have set up in the Find panel. This can be done via the keyboard shortcut, even when the Find panel is closed.

**Find Previous (⇧⌘G)** As above, only it will seek backward in the text instead of forward.

**Use Selection for Find (⌘E)** Use the currently selected text, or the entire contents of the selected note, as your search term. You could then immediately use Find Next/Previous, or load the Find panel and refine the search parameters or supply a replacement text.

**Jump to Selection (⌘J)** Scrolls the view so that the currently selected text is positioned in the middle of the window (or as close as possible to it). Useful if you want to quickly check another area of the board and then passively return to where you were, without typing or removing the selection.

**Spelling and Grammar ▶** Accesses the standard macOS spell check and grammar system (for supported languages). The contents of this menu are the same as can be seen in any standard Mac program, such as TextEdit or Scrivener.

Spell checking must be used in a text editing context only.

**Substitutions ▶** <Mac OS X 10.7+> Access to substitutions such as smart quotes and other symbols.

**Transformations** ▶ **⌘Mac OS X 10.7+** Access to text utilities for converting text case.

**Speech** ▶ Access to the text-to-speech synthesis engine supplied by the OS.

---

**Start Dictation** **⌘Mac OS X 10.8+** For computers capable of recording audio and making use of the OS X speech-to-text dictation system, this can be used to speak words aloud and have them turned into editable text.

**Special Characters...** (**⌘T**) Loads the OS X Unicode character browser. Use this to insert characters that are not found on your keyboard.

## 12.4 View Menu

The “View” menu controls how the current Scapple board is displayed, as well as whether or not the Inspector sidebar tied to that board is shown.

**Show (Hide) Inspector** (**⌘I**) The Inspector sidebar holds useful formatting tools for both selected notes & shapes, as well as for the document itself. This shortcut toggles its visibility on and off. Read more about the Inspector ([chapter 10](#)).

**Show (Hide) Footer Bar** **⌘/** Toggles the visibility of the Footer Bar, along the bottom of the window. This will be remembered for future boards as well. If you turn off the footer bar in an existing board, a newly created board will also have its footer bar disabled. Existing boards will remember what they have been set to.

---

**Page Guides** Toggles the visibility of printed page guides ([subsection 9.3.1](#)) on the Scapple board background. Using these guides, you can see where one sheet of paper will end and another will begin, making it easier to avoid situations where notes straddle a page break.

---

**Actual Size** (**⌘0**) Reverts the current zoom level of the view to the default level. This can also be done by clicking the **Reset** button in the Footer Bar.

**Zoom To Fit** (**⌘9**) Adjusts the zoom by increasing or decreasing the magnification so that every note on the map can be seen at once.

**Zoom In** (**⌘↑**) Incrementally increase the magnification of the board. The slider in the Footer Bar can also be used to adjust the scale of the board visually.

**Zoom Out** (**⌘**↓) Incrementally decreases the magnification of the board.

**Zoom To Selection** (**⌘**\*) Works in a fashion similar to **View ▶ Zoom to Fit**, save that only those notes that are selected will be fitted into the view.

**Zoom To Random** (**⌘**R) Zooms the view to a random note anywhere on the board.

---

**Enter Full Screen** (**⌘**F) **<Mac OS X 10.7+>** Expands the current window to fill the entire display, pushing aside the menu bar and the system Dock. This places the window on its own “Space” in Apple’s Mission Control. Each document must occupy its own Space.

**QuickZoom** (**Z**) On account of how this feature works, it cannot be listed in a menu as it only works while the keyboard shortcut is depressed. However it is listed here as it deserves mention with these other features. QuickZoom will act a bit like **View ▶ Zoom to Fit**, but only while the shortcut key is held down. When the key is released, the zoom will snap back to its original level, with the location you are pointing at with your mouse scrolled into view. So long as the key is held down you can manipulate existing notes, moving them around and drawing connections between them.

## 12.5 Notes Menu

Provides commands for creating, manipulating and organising notes and shapes within the active board, or the current selection.

**New (Stacked) Note** (**⌘**Return) When no notes are selected, this will be labelled, “New Note”, and it will create a note roughly in the middle of the current view.

If a shape is selected, it will act likewise, but the new note will be placed overlapping the shape.

When a note is selected, this command will create a new stacked note beneath the selected one. In cases where the selected note is somewhere in the middle of an existing stack, room will be made for the new note after it, and before the one following it.

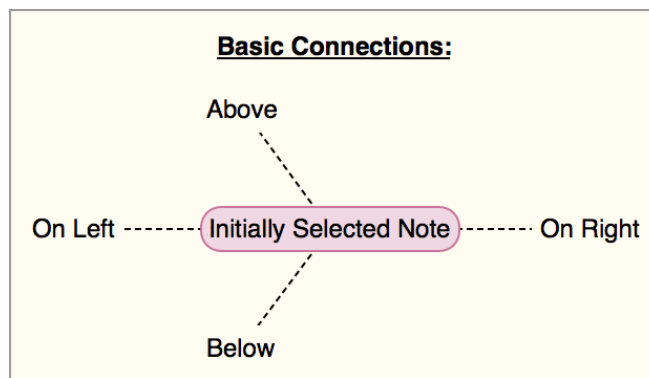

Read [Creating Notes \(subsection 4.2.1\)](#) for more information on how to make new notes, and [Stacks \(section 4.5\)](#).

**New Background Shape (Around Selection)** When nothing is selected, this command will create a new shape roughly in the middle of the view. If anything is selected (including other shapes), the shape will be pre-sized to fit around the entire selection, and the menu label will read, “New Background Shape Around Selection”.

**New Connected Note** ▶ This sub-menu provides convenience commands for creating new notes pre-connected to the currently selected notes. These commands are directional, and their keyboard shortcuts can be combined with the arrow keys on your keyboard in a logical fashion. Read more about Connections ([section 4.3](#)).

When creating new notes using these commands, they will by default automatically acquire the style of the initially selected note. In the screenshots depicting the results of these actions, this effect is not shown, to clarify which note is the “hub”. To create this example, the centre note was styled after the new connected notes were created. This behaviour can be changed in the Preferences ([chapter 11](#)).

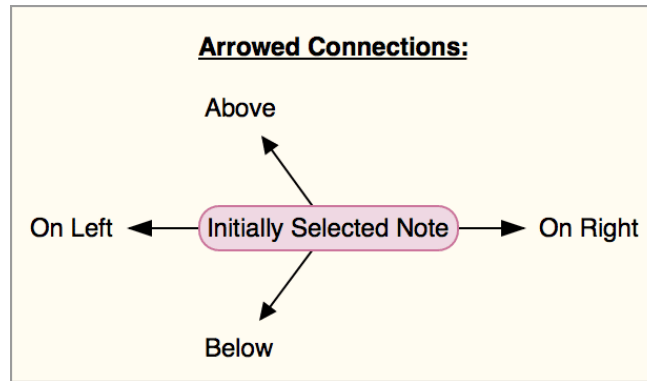

**Figure 12.1** New connected notes in the four directions.

The first group of commands create simple dashed connections to the new note ([Figure 12.1](#)):

- On Left (^⌘ ←)
- On Right (^⌘ →)
- Above (^⌘ ↑)
- Below (^⌘ ↓)

The second group of commands will create an arrowed connection pointing to the new note ([Figure 12.2](#)):

- On Left With Arrow (^⌘⌥ ←)
- On Right With Arrow (^⌘⌥ →)
- Above With Arrow (^⌘⌥ ↑)
- Below With Arrow (^⌘⌥ ↓)

**Figure 12.2** New arrowed notes in the four directions.

**Connect** ( $\text{⌘} >$ ) Connects two or more selected notes and/or shapes together. The item selected first will form the “hub” for the connecting lines, when more than two notes or shapes are selected. If you are looking for a way to connect every selected note with every other selected note, use **Notes ▶ Connect All**, below.

**Connect All** Connects each note or shape with every other item in the selection.

**Connect With Arrow** ( $\text{⌘} \text{⌘} .$ ) Connects two or more selected notes and/or shapes together. The item selected first will be the one which points to the subsequently selected items. If you are looking for a way to connect multiple notes back to a single note, it is best to use the mouse to drag a selection of notes onto the target note, with  $\text{⌘} \text{⌘}$  held down.

**Remove Arrows** ( $\text{⌘} \text{⌘} ,$ ) Remove all arrows from the selected notes, reverting them to basic dashed line connections.

**Disconnect** ( $\text{⌘} <$ ) Completely disconnects all selected notes/shapes among each other, or if only a single item is selected, any lines of connection leading to or from it.

---

**Connection Label...**  $\text{⌘} \text{⌘} \text{L}$  The two selected notes will have their connecting line annotated with the text you provide in the subsequent dialogue. The notes will be connected with a dotted line if they were not already connected before adding a label. See more in Labelling Connection Lines ([subsection 4.3.5](#)).

---

**Magnetic** ( $\text{⌘} \text{⌘} \text{M}$ ) Applicable only the background shapes, this will toggle whether or not the shape will magnetically carry overlapping notes with it, when the shape is moved ([subsection 4.4.4](#)).

**Stack (⌘)** Applicable to selections of two or more notes. Notes will be stacked in order of distance (in any direction) from the initial selection. When the initial note is already in a stack, the other selected notes will be inserted into the stack beneath that note, moving existing stacked notes down to make space for them.

**Auto-Fit** When used on a note, the width of the note will be resized to fit the amount of text in the note, so that no lines within it are wrapped.

When used on a background shape, the shape will be resized to fit around any overlapping notes and/or shapes.

**Align ▶** Provides tools for tidying up the placement of notes amongst the selection.

The first group will move all notes to match the indicated edge of the note selected first:

- Left Edges
- Right Edges
- Top Edges
- Bottom Edges

The second group will align notes by the centre of the first-selected note, respective to the axis chosen:

- Horizontal Centers: draws an imaginary line vertically through the note or shape. The items will be moved horizontally until their respective lines are all matching.
- Vertical Centers: likewise, although with the imaginary line drawn horizontally through the note or shape.

**Center in Background Shape** Applicable only to a single selected note that is overlapping a shape. The note will be centred both vertically and horizontally within the shape.

These commands align notes relative to the background shape they overlap ([subsection 4.4.6](#)):

- Center Horizontally in Background Shape: moves the selected notes horizontally until they are all aligned in a column within the horizontal centre of the shape they overlap.
- Center Vertically in Background Shape: likewise, although by moving notes vertically so that they are all on a line that is in the vertical centre of the shape.

**Distribute** ▶ Distribute considers the total width or height of the selection, and will move all of the notes in between the two extreme end notes so that the relative space between them is equal. Distribution only works on a single axis. Notes will not be moved vertically, when horizontal distribution is used, and vice versa.

In some cases, if the notes all together have more width than the sum would provide for in the total width of the selection, overlapping can occur.

**Figure 12.3** The results of using horizontal distribution on four notes.

**Horizontally** Distributes the notes evenly along the horizontal axis. No notes will be displaced up or down on the board.

**Vertically** Distributes notes evenly along the vertical axis. No notes will be displaced left or right on the board.

---

**Make Same Width** Adjusts the width of all notes and/or shapes in the selection so that they all have the same width as the first note selected. This will be done without moving the notes on the board.

**Make Same Height** Adjusts the height of shapes and images (not notes, which cannot be manually resized to be taller than the amount of text they contain) in the same fashion as resizing them by width, above.

---

**Split** (⌘K) Applicable only when editing text within a note. The note will be split at the point of the cursor and stacked beneath the current note. If text is selected, only the selected text will be split into a new note, removing it from the original.

**Merge** Operates on two or more notes in a selection. They will be merged together in order of distance from the initially selected note (in any direction), so that all of the text is displayed in a single note.

---

**Bring Forward (To Front) (⌘⇧F)** When notes or shapes are overlapping one another, this command will bring the selected items to the top. This and the following command will make no impact on connection lines. Connections will *always* be drawn in a predetermined level—no matter where the items they come from are displayed.

**Send To Back (⌘⇧B)** As above, only the selected items will be pushed to the bottom of the stack.

## 12.6 Format Menu

The “Format” menu is used to set the appearance of notes, the text within them, and shapes. All of the format settings that can be applied to notes can be saved into “Note Styles”.

**Note Style ▶** Note styles provide a way to save select appearance attributes of a note or shape, and quickly recall them later on selected items on the board. Styles are saved into each document separately. A few presets will be created into new documents as practical examples. Read more about Note Style Presets ([section 6.3](#)).

**New Note Style From Selection** Applicable when only a single note or shape has been selected. This will bring up the “New Style” panel, where you can choose what aspects of the selected note will be saved into the style for future use.

---

**Apply Note Style ▶** Operates on all selected notes and/or shapes, applying the selected style to them. In some cases, this may mean that not all of the style’s instructions will apply to the selection. For example if a style has been set to make shapes magnetic, any *notes* in that selection will ignore that setting. Likewise text formatting will be ignored by shapes.

This sub-menu is also accessible via the right-click contextual menu.

**Delete Note Style ▶** Remove a selected style from the current document. This will not impact any notes that have had that style applied to them in the past.

---

**Redefine Note Style From Selection** ▶ Applicable when only a single note or shape is selected. The chosen style will be updated with the selected item's formatting characteristics. As with deleting styles, this will *not* impact notes that have had this style applied to them in the past.

---

**Copy Note Style** (⌘⌘C) Applicable when only a single note or shape is selected. This command (and its sibling command, below) is useful if you wish to duplicate formatting between notes or shapes, and do not anticipate needing to do so repeatedly (saving a note style might be a better choice, in that case). This command copies *all* applicable formatting attributes.

**Paste Note Style** (⌘⌘V) Pastes the currently stored formatting characteristics, from the **Format ▶ Note Style ▶ Copy Note Style** menu command, to the selected items.

---

**Import Note Styles...** Batch import all of the styles from another Scapple document on the disk. This will not overwrite any existing styles in the document. So if any styles have the same name, you will see duplicate entries, and may wish to rename them. You can do so by applying the style to a note and then using the **Format ▶ Note Style ▶ Redefine Note Style From Selection** sub-menu.

---

**Font** ▶ The following commands can be used to style notes, or alternatively, selected ranges of text within a note. They each work in a toggle fashion. Read more about Note and Shape Style Options ([section 6.2](#)).

- Bold (⌘B)
  - Italic (⌘I)
  - Underline (⌘U)
  - Strikethrough (Shift⌘-)
- 

**Bigger** (⌘+) Incrementally increases the text size of the entire note.

To set the precise point size of the text, use The Inspector ([chapter 10](#)).

**Smaller** (⌘-) Incrementally decreases the text size of the entire note.

**Alignment** ▶ Alignment impacts the position of text *within* the note's total width. These forms of alignment should be familiar from any word processor. If you are looking to align the notes themselves amongst one another, use the **Notes** ▶ **Align** ▶ sub-menu.

If the width of the note is precisely as wide as the text content within it, these commands may not appear to do anything. Experimentally changing the width of the note should prove they have worked.

- Align Left (⌘⇧L)
- Center (⌘⇧C)
- Justify (⌘⇧J)
- Align Right (⌘⇧R)

**Indents** ▶ Indenting adjusts the amount of block padding on the left of the text (or the right, when typing in right-to-left mode) by a fixed amount. Indenting is often useful when forming lists of notes in a stack. The overall width of the note will not be changed by this command, only the formatting of the text within it.

- Increase Indent Level **Tab**
- Decrease Indent Level ⇧**Tab**
- Remove Indents : Removes all applied indenting from the selected notes.

**Colors** ▶ The “Colors” sub-menu provides access to the three main characteristics of notes and shapes that can have their colour changed: text (for notes), borders and the background fill.

**Change Text Color...** Will present the standard system colour palette. Any changes made to the palette will be immediately reflected upon the text of the selected notes. Ranges of text within a note cannot have their colour specifically changed.

**Clear Text Color** Removes any custom colour settings from the text of the selected notes. They will go back to using the document defaults, as set in the “Document” section of the Inspector ([chapter 10](#)).

---

**Change Fill Color...** (⇧⌘⇧C) Applicable to both notes and shapes, the selected background fill colour will change as colours are set using the system colour palette. Fill is the default colour type that will be changed if the palette is called up with the keyboard shortcut.

**Clear Fill Color** Removes any custom colour settings for the background fill on selected notes or shapes.

---

**Change Border Color...** Applicable to both notes and shapes, the selected items will have their border colours changed as colours are selected from the standard system colour palette. If items do not already have a border applied, the default one pixel border will be added to the note automatically. This is thus a convenient way to kill two birds with one stone if you wish to apply a custom border colour to a note that does not already have a border.

**Clear Border Color** Removes any custom colour settings for the border colour on selected notes or shapes.

**Borders ▶** Borders can be applied to any note, and shapes by default will have a one pixel black border. Use this sub-menu to adjust the appearance and width of borders. To remove a border, select “No Border” from the **Format ▶ Borders ▶** sub-menu. Read more about Applying Borders to Notes & Shapes ([subsection 6.2.4](#)).

The contents of this sub-menu can also be accessed from the right-click contextual menu.

**Border widths** Choose between five different border widths, or remove the border by selected “No Border”.

**Border styles** The second half of this sub-menu provides four different styles of border that you can choose from (rounded is the default).

---

**Writing Direction ▶** Users who write in a language that runs from right to left instead of from left to right can change this for the document here. This will also impact the auto-resize behaviour of notes (favouring the left side for expansion) and stacks (the right edge will be need to be flush, instead of the left).

---

**Shadow** Add a simple drop-shadow to the selected notes or shapes.

**Fade (⌘F)** Fading notes and shapes will reduce their visual impact on the board, by causing them to blend into the background colour or texture. When shapes are faded, any overlapping items will be faded as well, so long as they remain overlapping (they will return to full opacity if dragged out of the faded shape). Read more about Fading Notes ([subsection 6.2.6](#)).

## 12.7 Window Menu

A “window” refers to the standard container that holds the Scapple board, with the “traffic lights” along the top-left, document title in the middle, and resize handle on the bottom-right. This menu concerns itself with the management of these windows themselves.

**Minimize (⌘ M)** Reduce the active (topmost) window to an icon in the system Dock. Simply click on the icon to restore it, or use its named entry from the lower half of this menu.

**Zoom** Increases the size of the window to fill all available space, excluding any protected areas like the main application menu bar, and the system Dock. If you wish to utilise OS X 10.7+ full screen mode, use **View ▶ Enter Full Screen**.

**Bring All to Front** Pushes all Scapple documents to the top of your desktop window stack, obscuring any open windows from other applications behind them.

Below these stock commands, a list of each open Scapple document will be provided so that you can easily switch between documents, even if they are not currently visible. Documents that have been minimised will have a diamond icon to the left of their names.

## 12.8 Help Menu

Provides access to your Mac’s menu search utility, as well as useful tools and links for learning Scapple, or getting in touch with us.

The Help menu is the only menu that can be directly activated from the keyboard. Tap **⇧⌘ /** to call it up. This will place the cursor in the menu title search field, so you can begin searching immediately.

**Scapple Manual** A quick link to the PDF that you are likely reading. The version that ships with Scapple will be kept as up to date as possible, but newer revisions might also be available on the web site’s [support page](#)<sup>1</sup>.

**QuickStart Guide** A handy two-page reference that can be used to quickly learn the software.

---

**Support** A hyperlink to our web site’s support page. Here you can download the latest copy of the PDF in US Letter or A4 (or the Scrivener project used

---

to make it), find contact e-mail addresses, links to our forums and wiki, after-sales support from our vendor, eSellerate, and more.

**User Forums** Hyperlink to the official Literature & Latte forums where you can meet other people around the world using Scapple, share tips, report bugs, request tech support, or have a cup of latte in our off-topic section.

**Literature & Latte Home** A handy hyperlink to our [home page](http://www.literatureandlatte.com/)<sup>2</sup> which provides easy access to everything else we offer on our web site.

**Scapple Home** Link to the main [Scapple page](http://www.literatureandlatte.com/scapple.php)<sup>3</sup>, where you will find useful download links for updates, tutorials, links to share Scapple on Twitter and Facebook, and more.

---

**Purchase Scapple...** Ready to upgrade from the demo? Use this link to be taken to our online store. We accept most common forms of payment, and you'll be sent an unlock key shortly after payment has been verified electronically. This command will be removed from any purchased version of Scapple.

**|What's New**

13

## 13.1 Scapple 1.3

- The Inspector is now a docked sidebar in the board itself rather than a floating palette that is shared by all open boards. The individual tabs are now displayed in a stack.
- Note styles can now be displayed and used from the Inspector sidebar ([section 10.2](#)) as well as all of the methods you’ve become used to in the past.
- Keyboard shortcuts can be assigned to frequently used styles. Redefine the style to add one ([subsection 6.3.4](#)).
- Connector lines can now be labeled ([subsection 4.3.5](#)). Select the two connected notes and use the **Notes ▶ Connection Label...** menu command (**⌘⌘L**) to get started.

## 13.2 Scapple 1.3.2

- Dark Mode support added for macOS 10.14+ “Mojave”.

### **Code Contributions and Help**

- Andreas Mayer - NSBezierPath and table view extensions (<http://www.harmless.de/cocoa.html>).
- Andy Matuschak - Scapple uses the superb Sparkle framework for software updates, created by Andy Matuschak.
- Matt Gemmell - various code snippets
- Scapple's crash reporter is based on UKCrashReporter by Uli Kusterer.
- Daniel Jalkut of <http://www.red-sweater.com> for the great idea of allowing the non-Mac App Store version to be able to recognise App Store users.

### **App Store Receipt Validation**

Receipt validation code for the Mac App Store was created by Graham Lee (<http://fuzzyaliens.com>)

### **Sandwich Maker**

Keith Blount (seriously, I just like seeing my name in the credits)

### **Special Thanks To**

Jesse Grosjean of Hog Bay Software - the initial idea for Scapple was seeded in email conversations with Jesse several years ago about trying to digitise different forms of paper note-taking.

Everyone on the Literature & Latte forums for testing and providing lots of great ideas. And for giving me so much entertainment over the last several years.
